[3237] Nucleotide sequences of the VGAM114 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM114 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM114 are further described hereinbelow with reference to Table 1.

[3238] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM114 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM114 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3239] As mentioned hereinabove with reference to Fig. 1, a function of VGAM114 gene, herein designated VGAM is inhibition of expression of VGAM114 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM114 correlate with, and may be deduced

from, the identity of the target genes which VGAM114 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3240] SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704) is a VGAM114 host target gene. SAMHD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SAMHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAMHD1 BINDING SITE, designated SEQ ID:2594, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:449.

[3241] A function of VGAM114 is therefore inhibition of SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMHD1. LOC150864 (Accession XM_087026) is another VGAM114 host target gene. LOC150864 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150864, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150864 BINDING SITE, designated SEQ ID:3150, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:449.

[3242] Another function of VGAM114 is therefore inhibition of LOC150864 (Accession XM_087026). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150864. LOC257358 (Accession XM_173138) is another VGAM114 host target gene. LOC257358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257358 BINDING SITE, designated SEQ ID:3731, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:449.

[3243] Another function of VGAM114 is therefore inhibition of LOC257358 (Accession XM_173138). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257358. LOC90288 (Accession XM_030669) is another VGAM114 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:2621, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:449.

[3244] Another function of VGAM114 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 115 (VGAM115) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3245] VGAM115 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM115 was detected is described hereinabove with reference to Figs. 1–8.

[3246] VGAM115 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3247] VGAM115 gene encodes a VGAM115 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM115 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM115 precursor RNA is designated SEQ ID:101, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:101 is located at position 49784 relative to the genome of Vaccinia Virus.

[3248] VGAM115 precursor RNA folds onto itself, forming VGAM115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3249] An enzyme complex designated DICER COMPLEX, `dices` the VGAM115 folded precursor RNA into VGAM115 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM115 RNA is designated SEQ ID:450, and is provided hereinbelow with reference to the sequence listing part.

[3250] VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM115 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3251] VGAM115 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM115 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM115 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3252] The complementary binding of VGAM115 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM115 host target RNA into VGAM115 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3253] It is appreciated that VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM115 host target genes. The mRNA of each one of this plurality of VGAM115 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM115 RNA, herein designated VGAM RNA, and which when bound by VGAM115 RNA causes inhibition of translation of respective one or more VGAM115 host target proteins.

[3254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM115 gene, herein designated VGAM GENE, on one or more VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3255] It is yet further appreciated that a function of VGAM115 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM115 correlate with, and may be deduced from, the identity of the host target genes which VGAM115 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3256] Nucleotide sequences of the VGAM115 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM115 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM115 are further described hereinbelow with reference to Table 1.

[3257] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM115 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM115 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3258] As mentioned hereinabove with reference to Fig. 1, a function of VGAM115 gene, herein designated VGAM is inhibition of expression of VGAM115 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM115 correlate with, and may be deduced from, the identity of the target genes which VGAM115 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3259] Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817) is a VGAM115 host target gene. GAD1 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by GAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAD1 BINDING SITE, designated SEQ ID:777, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:450.

[3260] A function of VGAM115 is therefore inhibition of Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817), a gene which catalyzes the conversion of glutamic acid to gamma-aminobutyric acid. Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAD1. The function of GAD1 has been established by previous studies. Using a genomic probe from a human fetal brain library, Sparkes et al. (1987) probed the DNA of a mouse/human somatic cell hybrid panel and assigned the GAD gene to human chromosome 2. Kelly et al. (1992) confirmed the assignment of GAD1 to chromosome 2, using PCR to amplify specifically the human sequence in rodent/human somatic cell hybrid DNAs. They also reported the full nucleotide sequence of the cDNA and the deduced amino acid sequence. Bu et al. (1992) mapped the GAD1

gene to 2q31 by in situ hybridization of fluorescently labeled GAD probes to human chromosomes. They demonstrated that the GAD1 gene encodes a polypeptide of 67,000 molecular weight, with 594 amino acid residues. The GAD2 gene (OMIM Ref. No. 138275), located on 10p11.23, encodes a polypeptide of 65,000 molecular weight (GAD65), with 585 amino acid residues. Brilliant et al. (1990) showed by Southern analysis of mouse-hamster hybrid cells and by interspecific backcrosses and recombinant inbred strains that the mouse equivalent (Gad1) is located on chromosome 2 and that an apparent pseudogene is located on mouse chromosome 10. The mouse Gad1 locus is part of a conserved homology between mouse chromosome 2 and human 2q. By in situ hybridization, Edelhoff et al. (1993) also assigned GAD1 to human 2q31 and to mouse chromosome 2D in a known region of conservation between human and mouse. Animal model experiments lend further support to the function of GAD1. The remaining exon-intron boundaries occur at identical positions in the 2 cDNAs, suggesting that they derive from a common ancestral GAD gene. In addition to its role as an inhibitory neurotransmitter, GABA is presumed to be involved in the development and plasticity

of the nervous system. GABA is synthesized by glutamic acid decarboxylase, but the respective roles of its 2 isoforms, GAD65 and GAD67, had not been determined. Asada et al. (1996, 1997) undertook the selective elimination of each GAD isoform by gene targeting to clarify this issue. Asada et al. (1996) found that GAD65 $-/-$ mice showed no change in brain GABA content or animal behavior, except for a slight increase in susceptibility to seizures. Asada et al. (1997) produced GAD67 $-/-$ mice. These mice were born at the expected frequency but died of severe cleft palate during the first morning after birth. GAD activities and GABA contents were reduced to 20 and 7%, respectively, in the cerebral cortex of the newborn GAD67 $-/-$ mice. Their brains, however, did not show any discernible defects. Previous pharmacologic and genetic investigations suggested the involvement of GABA in palate formation, but this was the first demonstration of a role for GAD67-derived GABA in the development of non-neural tissue. Independently, Condie et al. (1997) found defects in the formation of the palate in mice with a targeted mutation in the gene encoding GAD67. Previous observations had suggested a role of GABA in palate development. Analysis of mice with mutations in the beta-3

gamma-GABA receptor (GABRB3; 137192) had demonstrated that these mutations are associated with cleft secondary palate in mice. The phenotype in the GABRB3 mutants showed that this gene is somehow involved in palate development but did not demonstrate that GABA is the ligand involved in this particular function. The results of Condie et al. (1997), demonstrating a similar phenotype between the receptor and ligand mutations, demonstrated a role for GABA signaling in normal palate development.

[3261] It is appreciated that the abovementioned animal model for GAD1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3262] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3263] Asada, H.; Kawamura, Y.; Maruyama, K.; Kume, H.; Ding, R.-G.; Ji, F. Y.; Kanbara, N.; Kuzume, H.; Sanbo, M.; Yagi, T.; Obata, K. : Mice lacking the 65 kDa isoform of glutamic acid decarboxylase (GAD65) maintain normal levels of GAD67 and GABA in their brains but are susceptible to seizures. *Biochem. Biophys. Res. Commun.* 229: 891-895, 1996. ; and

- [3265] Further studies establishing the function and utilities of GAD1 are found in John Hopkins OMIM database record ID 605363, and in cited publications numbered 2764–1540, 2765–1542, 2766–1545, 309–31 and 1546 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kelch-like 2, Mayven (Drosophila) (KLHL2, Accession NM_007246) is another VGAM115 host target gene. KLHL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL2 BINDING SITE, designated SEQ ID:1371, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:450.
- [3266] Another function of VGAM115 is therefore inhibition of Kelch-like 2, Mayven (Drosophila) (KLHL2, Accession NM_007246). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with KLHL2. KIAA0276 (Accession XM_048199) is another VGAM115 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:2904, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:450.

[3267] Another function of VGAM115 is therefore inhibition of KIAA0276 (Accession XM_048199). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. LOC130814 (Accession XM_059471) is another VGAM115 host target gene. LOC130814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130814 BINDING SITE, designated SEQ ID:3012, to the

nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:450.

[3268] Another function of VGAM115 is therefore inhibition of LOC130814 (Accession XM_059471). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130814. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 116 (VGAM116) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3269] VGAM116 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM116 was detected is described hereinabove with reference to Figs. 1–8.

[3270] VGAM116 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3271] VGAM116 gene encodes a VGAM116 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM116 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM116 precursor RNA is designated SEQ ID:102, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:102 is located at position 48815 relative to the genome of Vaccinia Virus.

[3272] VGAM116 precursor RNA folds onto itself, forming VGAM116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3273] An enzyme complex designated DICER COMPLEX, `dices` the VGAM116 folded precursor RNA into VGAM116 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM116 RNA is designated SEQ ID:451, and is provided hereinbelow with reference to the sequence listing part.

[3274] VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM116 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3275] VGAM116 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM116 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM116 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3276] The complementary binding of VGAM116 RNA, herein designated VGAM RNA, to host target binding sites on VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM116 host target RNA into VGAM116 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3277] It is appreciated that VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM116 host target genes. The mRNA of each one of this plurality of VGAM116 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM116 RNA, herein designated VGAM RNA, and which when bound by VGAM116 RNA causes inhibition of translation of respective one or more VGAM116 host target proteins.

[3278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM116 gene, herein designated VGAM GENE, on one or more VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[3279] It is yet further appreciated that a function of VGAM116 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM116 correlate with, and may be deduced from, the identity of the host target genes which VGAM116 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[3280] Nucleotide sequences of the VGAM116 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM116 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM116 are further described hereinbelow with reference to Table 1.

[3281] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM116 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM116 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3282] As mentioned hereinabove with reference to Fig. 1, a function of VGAM116 gene, herein designated VGAM is inhibition of expression of VGAM116 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM116 correlate with, and may be deduced from, the identity of the target genes which VGAM116 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3283] Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242) is a VGAM116 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:1002, to the nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:451.

[3284] A function of VGAM116 is therefore inhibition of Trans-

forming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB2. KIAA1223 (Accession XM_048747) is another VGAM116 host target gene. KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:2908, to the nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:451.

[3285] Another function of VGAM116 is therefore inhibition of KIAA1223 (Accession XM_048747). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. PRO2859 (Accession NM_018543) is another VGAM116 host target gene. PRO2859 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2859, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2859 BINDING SITE, designated SEQ ID:1840, to the nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:451.

[3286] Another function of VGAM116 is therefore inhibition of PRO2859 (Accession NM_018543). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2859. PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222) is another VGAM116 host target gene. PSIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSIP2 BINDING SITE, designated SEQ ID:2324, to the nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:451.

[3287] Another function of VGAM116 is therefore inhibition of PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PSIP2. LOC152185 (Accession NM_144718) is another VGAM116 host target gene. LOC152185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152185 BINDING SITE, designated SEQ ID:2497, to the nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:451.

[3288] Another function of VGAM116 is therefore inhibition of LOC152185 (Accession NM_144718). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152185. LOC89953 (Accession NM_138343) is another VGAM116 host target gene. LOC89953 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89953 BINDING SITE, designated SEQ ID:2437, to the

nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:451.

[3289] Another function of VGAM116 is therefore inhibition of LOC89953 (Accession NM_138343). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89953. LOC90509 (Accession XM_032209) is another VGAM116 host target gene. LOC90509 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90509 BINDING SITE, designated SEQ ID:2649, to the nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:451.

[3290] Another function of VGAM116 is therefore inhibition of LOC90509 (Accession XM_032209). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90509. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 117 (VGAM117) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3291] VGAM117 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM117 was detected is described hereinabove with reference to Figs. 1–8.

[3292] VGAM117 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3293] VGAM117 gene encodes a VGAM117 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM117 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM117 precursor RNA is designated SEQ ID:103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:103 is located at position 51120 relative to the genome of Vaccinia Virus.

[3294] VGAM117 precursor RNA folds onto itself, forming VGAM117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3295] An enzyme complex designated DICER COMPLEX, `dices` the VGAM117 folded precursor RNA into VGAM117 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM117 RNA is designated SEQ ID:452, and is provided hereinbelow with reference to the sequence listing part.

[3296] VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM117 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM117 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3297] VGAM117 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM117 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM117 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM117 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM117 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3298] The complementary binding of VGAM117 RNA, herein designated VGAM RNA, to host target binding sites on VGAM117 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM117 host target RNA into VGAM117 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3299] It is appreciated that VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM117 host target genes. The mRNA of each one of this plurality of VGAM117 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM117 RNA, herein designated VGAM RNA, and which when bound by VGAM117 RNA causes inhibition of translation of respective one or more VGAM117 host target proteins.

[3300] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM117 gene, herein designated VGAM GENE, on one or more VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3301] It is yet further appreciated that a function of VGAM117 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM117 correlate with, and may be deduced from, the identity of the host

target genes which VGAM117 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3302] Nucleotide sequences of the VGAM117 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM117 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM117 are further described hereinbelow with reference to Table 1.

[3303] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM117 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM117 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3304] As mentioned hereinabove with reference to Fig. 1, a function of VGAM117 gene, herein designated VGAM is inhibition of expression of VGAM117 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM117 correlate with, and may be deduced from, the identity of the target genes which VGAM117

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3305] 3'(2'), 5'-bisphosphate Nucleotidase 1 (BPNT1, Accession XM_035738) is a VGAM117 host target gene. BPNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BPNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPNT1 BINDING SITE, designated SEQ ID:2702, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:452.

[3306] A function of VGAM117 is therefore inhibition of 3'(2'), 5'-bisphosphate Nucleotidase 1 (BPNT1, Accession XM_035738). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPNT1. FLJ21709 (Accession NM_032206) is another VGAM117 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:2235, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:452.

[3307] Another function of VGAM117 is therefore inhibition of FLJ21709 (Accession NM_032206). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. MGC13007 (Accession NM_032320) is another VGAM117 host target gene. MGC13007 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13007 BINDING SITE, designated SEQ ID:2246, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:452.

[3308] Another function of VGAM117 is therefore inhibition of MGC13007 (Accession NM_032320). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13007. MGC14407 (Accession NM_032908) is an-

other VGAM117 host target gene. MGC14407 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC14407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14407 BINDING SITE, designated SEQ ID:2294, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:452.

[3309] Another function of VGAM117 is therefore inhibition of MGC14407 (Accession NM_032908). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14407. LOC151201 (Accession XM_098021) is another VGAM117 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:3341, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:452.

[3310] Another function of VGAM117 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC197131 (Accession XM_113823) is another VGAM117 host target gene. LOC197131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197131 BINDING SITE, designated SEQ ID:3419, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:452.

[3311] Another function of VGAM117 is therefore inhibition of LOC197131 (Accession XM_113823). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197131. LOC219942 (Accession XM_167790) is another VGAM117 host target gene. LOC219942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219942, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:3598, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:452.

[3312] Another function of VGAM117 is therefore inhibition of LOC219942 (Accession XM_167790). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219942. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 118 (VGAM118) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3313] VGAM118 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM118 was detected is described hereinabove with reference to Figs. 1–8.

[3314] VGAM118 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM118 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[3315] VGAM118 gene encodes a VGAM118 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM118 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM118 precursor RNA is designated SEQ ID:104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:104 is located at position 50980 relative to the genome of Vaccinia Virus.

[3316] VGAM118 precursor RNA folds onto itself, forming VGAM118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3317] An enzyme complex designated DICER COMPLEX, `dices` the VGAM118 folded precursor RNA into VGAM118 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM118 RNA is designated SEQ ID:453, and is provided hereinbelow with reference to the sequence listing part.

[3318] VGAM118 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM118 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM118 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3319] VGAM118 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM118 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM118 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM118 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM118 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3320] The complementary binding of VGAM118 RNA, herein designated VGAM RNA, to host target binding sites on VGAM118 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM118 host target RNA into VGAM118 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[3321] It is appreciated that VGAM118 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM118 host target genes. The mRNA of each one of this plurality of VGAM118 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM118 RNA, herein designated VGAM RNA, and which when bound by VGAM118 RNA causes inhibition of translation of respective one or more VGAM118 host target proteins.

[3322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM118 gene, herein designated VGAM GENE, on one or more VGAM118 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3323] It is yet further appreciated that a function of VGAM118 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM118 correlate with, and may be deduced from, the identity of the host target genes which VGAM118 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3324] Nucleotide sequences of the VGAM118 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM118 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM118 are further described hereinbelow with reference to Table 1.

[3325] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM118 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM118 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3326] As mentioned hereinabove with reference to Fig. 1, a function of VGAM118 gene, herein designated VGAM is inhibition of expression of VGAM118 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM118 correlate with, and may be deduced from, the identity of the target genes which VGAM118 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3327] Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM_018644) is a VGAM118 host target gene. B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GAT1 BINDING SITE1

and B3GAT1 BINDING SITE2, designated SEQ ID:1855 and SEQ ID:2362 respectively, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3328] A function of VGAM118 is therefore inhibition of Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM_018644). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. Zinc Finger Protein 76 (expressed in testis) (ZNF76, Accession NM_003427) is another VGAM118 host target gene. ZNF76 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF76, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF76 BINDING SITE, designated SEQ ID:1019, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3329] Another function of VGAM118 is therefore inhibition of Zinc Finger Protein 76 (expressed in testis) (ZNF76, Accession NM_003427). Accordingly, utilities of VGAM118

include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF76. DKFZp434M0331 (Accession NM_017600) is another VGAM118 host target gene. DKFZp434M0331 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434M0331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434M0331 BINDING SITE, designated SEQ ID:1727, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3330] Another function of VGAM118 is therefore inhibition of DKFZp434M0331 (Accession NM_017600). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434M0331. FLJ20666 (Accession NM_017922) is another VGAM118 host target gene. FLJ20666 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE, designated SEQ ID:1763, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3331] Another function of VGAM118 is therefore inhibition of FLJ20666 (Accession NM_017922). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is another VGAM118 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:2064, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3332] Another function of VGAM118 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with FYCO1. Interleukin Enhancer Binding Factor 3, 90kDa (ILF3, Accession NM_004516) is another VGAM118 host target gene. ILF3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ILF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ILF3 BINDING SITE, designated SEQ ID:1121, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3333] Another function of VGAM118 is therefore inhibition of Interleukin Enhancer Binding Factor 3, 90kDa (ILF3, Accession NM_004516). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILF3. KIAA0193 (Accession NM_014766) is another VGAM118 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated

SEQ ID:1544, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3334] Another function of VGAM118 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA1163 (Accession XM_086231) is another VGAM118 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1163 BINDING SITE, designated SEQ ID:3121, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3335] Another function of VGAM118 is therefore inhibition of KIAA1163 (Accession XM_086231). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. KIAA1247 (Accession XM_030036) is another VGAM118 host target gene. KIAA1247 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1247 BINDING SITE, designated SEQ ID:2609, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3336] Another function of VGAM118 is therefore inhibition of KIAA1247 (Accession XM_030036). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1247. KIAA1870 (Accession NM_032888) is another VGAM118 host target gene. KIAA1870 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1870 BINDING SITE, designated SEQ ID:2293, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3337] Another function of VGAM118 is therefore inhibition of

KIAA1870 (Accession NM_032888). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1870. LOC146517 (Accession XM_085491) is another VGAM118 host target gene. LOC146517 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146517, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146517 BINDING SITE, designated SEQ ID:3095, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3338] Another function of VGAM118 is therefore inhibition of LOC146517 (Accession XM_085491). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146517. LOC162083 (Accession XM_091339) is another VGAM118 host target gene. LOC162083 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC162083 BINDING SITE, designated SEQ ID:3242, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3339] Another function of VGAM118 is therefore inhibition of LOC162083 (Accession XM_091339). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162083. LOC220477 (Accession XM_071675) is another VGAM118 host target gene. LOC220477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220477 BINDING SITE, designated SEQ ID:3041, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3340] Another function of VGAM118 is therefore inhibition of LOC220477 (Accession XM_071675). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220477. LOC222237 (Accession XM_168592) is an-

other VGAM118 host target gene. LOC222237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222237 BINDING SITE, designated SEQ ID:3650, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3341] Another function of VGAM118 is therefore inhibition of LOC222237 (Accession XM_168592). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222237. LOC255096 (Accession XM_174913) is another VGAM118 host target gene. LOC255096 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255096 BINDING SITE, designated SEQ ID:3745, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3342] Another function of VGAM118 is therefore inhibition of LOC255096 (Accession XM_174913). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255096. LOC92340 (Accession XM_044426) is another VGAM118 host target gene. LOC92340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92340 BINDING SITE, designated SEQ ID:2837, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:453.

[3343] Another function of VGAM118 is therefore inhibition of LOC92340 (Accession XM_044426). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92340. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 119 (VGAM119) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[3344] VGAM119 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM119 was detected is described hereinabove with reference to Figs. 1–8.

[3345] VGAM119 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM119 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3346] VGAM119 gene encodes a VGAM119 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM119 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM119 precursor RNA is designated SEQ ID:105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:105 is located at position 52159 relative to the genome of Vaccinia Virus.

[3347] VGAM119 precursor RNA folds onto itself, forming VGAM119 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[3348] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM119 folded precursor RNA into VGAM119 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 81%) nucleotide se-
quence of VGAM119 RNA is designated SEQ ID:454, and is
provided hereinbelow with reference to the sequence list-
ing part.

[3349] VGAM119 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM119 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM119 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3350] VGAM119 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM119 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM119 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM119 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM119 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3351] The complementary binding of VGAM119 RNA, herein designated VGAM RNA, to host target binding sites on VGAM119 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM119 host target RNA into VGAM119 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3352] It is appreciated that VGAM119 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM119 host target genes. The mRNA of each one of this plurality of VGAM119 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM119 RNA, herein designated VGAM RNA, and which when bound by VGAM119 RNA causes inhibition of translation of respective one or more VGAM119 host target proteins.

[3353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM119 gene, herein designated VGAM GENE, on one or more VGAM119 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3354] It is yet further appreciated that a function of VGAM119 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM119 correlate with, and may be deduced from, the identity of the host target genes which VGAM119 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [3355] Nucleotide sequences of the VGAM119 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM119 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM119 are further described hereinbelow with reference to Table 1.
- [3356] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM119 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM119 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [3357] As mentioned hereinabove with reference to Fig. 1, a function of VGAM119 gene, herein designated VGAM is inhibition of expression of VGAM119 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM119 correlate with, and may be deduced from, the identity of the target genes which VGAM119 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3358] Arginase, Liver (ARG1, Accession NM_000045) is a VGAM119 host target gene. ARG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARG1 BINDING SITE, designated SEQ ID:700, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3359] A function of VGAM119 is therefore inhibition of Arginase, Liver (ARG1, Accession NM_000045). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARG1. BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813) is another VGAM119 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:1964, to the nucleotide sequence of

VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3360] Another function of VGAM119 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 has been established by previous studies. By screening a K562 erythroleukemia cell line with mouse Bach2 cDNA as the probe, Sasaki et al. (2000) isolated a cDNA encoding BACH2. The deduced 841-amino acid protein is 89.5% identical to mouse Bach2, with 97% identity shared in the BTB and bZip functional domains and 94% identity shared in the serine-rich region. Northern blot analysis revealed expression of an approximately 11.0-kb BACH2 transcript restricted to thymus, spleen, and leukocytes; low levels were also detected in small intestine and brain. Sasaki et al. (2000) found mRNA and protein expression primarily in B-lymphoid rather than other hematopoietic cell lines. RT-PCR analysis showed that BACH2, like mouse Bach2, is expressed in primary B

cells at the progenitor, precursor, immature, and mature B-cell stages. Mouse Bach2 is not expressed in plasma cells (Muto et al., 1998). Gel shift analysis showed that when overexpressed, BACH2 binds to MAF recognition elements (MARE). Overexpression also resulted in a loss of clonogenic activity. Southern blot analysis determined that BACH2 is a single-copy gene. BACH2/CA-1 microsatellite analysis indicated that loss of heterozygosity occurred in 5 of 25 non-Hodgkin lymphoma (OMIM Ref. No. 605027) patients.

[3361] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3362] Sasaki, S.; Ito, E.; Toki, T.; Maekawa, T.; Kanezaki, R.; Umenai, T.; Muto, A.; Nagai, H.; Kinoshita, T.; Yamamoto, M.; Inazawa, J.; Taketo, M. M.; Nakahata, T.; Igarashi, K.; Yokoyama, M. : Cloning and expression of human B cell-specific transcription factor BACH2 mapped to chromosome 6q15. *Oncogene* 19: 3739–3749, 2000. ; and

[3363] Muto, A.; Hoshino, H.; Madisen, L.; Yanai, N.; Obinata, M.; Karasuyama, H.; Hayashi, N.; Nakauchi, H.; Yamamoto, M.; Groudine, M.; Igarashi, K. : Identification of Bach2 as a B-cell-spe.

[3364] Further studies establishing the function and utilities of BACH2 are found in John Hopkins OMIM database record ID 605394, and in cited publications numbered 165 and 1658 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cerebellar Degeneration-related Protein 1, 34kDa (CDR1, Accession NM_004065) is another VGAM119 host target gene. CDR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDR1 BINDING SITE, designated SEQ ID:1083, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3365] Another function of VGAM119 is therefore inhibition of Cerebellar Degeneration-related Protein 1, 34kDa (CDR1, Accession NM_004065). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDR1. Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM_039627) is another VGAM119 host target gene. CNTN3 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by CNTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN3 BINDING SITE, designated SEQ ID:2758, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3366] Another function of VGAM119 is therefore inhibition of Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM_039627), a gene which may play a role in the initial growth and guidance of axons. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN3. The function of CNTN3 has been established by previous studies. Pang, a mouse gene encoding a neuronal adhesion molecule, was isolated as a plasmacytoma-specific transcript using an RT-PCR-based strategy in an attempt to isolate Myc-like genes in murine plasmacytomas (Connelly et al., 1994). Pang is a member of the immunoglobulin/fibronectin superfamily of adhesion molecules; its closest relatives, TAG1 (OMIM Ref. No. 190197) and contactin 1 (OMIM Ref. No. 600016), pro-

mote axon growth and migration. The normal site of Pang expression is the brain, where it is detected as 4.0- and 6.1-kb RNAs on Northern blots; Pang is not detected in other normal tissues. Abnormally sized Pang transcripts were uniquely found in murine plasmacytomas, where it is ectopically activated by intracisternal A-type particle long terminal repeats. Mock et al. (1996) mapped the Pang gene to mouse chromosome 6 by somatic cell hybrid analysis and further positioned it on the chromosome between Wnt7a and Pcp1. Southern blot analysis of human-rodent somatic cell hybrids together with predictions from the mouse map location indicated that human PANG is located at 3p26

[3367] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3368] Connelly, M. A.; Grady, R. C.; Mushinski, J. F.; Marcu, K. B. : PANG, a gene encoding a neuronal glycoprotein, is ectopically activated by intracisternal A-type particle long terminal repeats in murine plasmacytomas. Proc. Nat. Acad. Sci. 91: 1337-1341, 1994. ; and

[3369] Mock, B. A.; Connelly, M. A.; McBride, O. W.; Kozak, C. A.; Marcu, K. B. : Plasmacytoma-associated neuronal glyco-

protein, Pang, maps to mouse chromosome 6 and human chromosome 3. Genomic.

[3370] Further studies establishing the function and utilities of CNTN3 are found in John Hopkins OMIM database record ID 601325, and in cited publications numbered 2122–2123 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053) is another VGAM119 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:2748, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3371] Another function of VGAM119 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG

has been established by previous studies. Members of the nuclear receptor superfamily are important regulators of development, cell proliferation, and physiology. During an analysis of the critical region of type IIa Usher syndrome (USH2A; 276901) at 1q41, Eudy et al. (1998) constructed a cDNA contig of ESRRG. Northern blot analysis detected a 5.5-kb ESRRG transcript in a variety of human adult and fetal tissues, with the highest level in fetal brain. The predicted 436-amino acid ESRRG protein, which is a member of the steroid/thyroid/retinoid receptor superfamily, is 76% identical to the orphan receptor ESRRB (OMIM Ref. No. 602167) and 63% identical to ESRRG (OMIM Ref. No. 601998). Heard et al. (2000) reported that the ESRRG mRNA is highly alternatively spliced at the 5-prime end, giving rise to a number of tissue-specific RNA species, some of which encode protein isoforms differing in the N-terminal region. Like ESRRG and ESRRB, ESRRG binds as a monomer to an ERR-alpha response element (ERRE). Hong et al. (1999) identified mouse *Esrrg*, which they called *Err3*, by yeast 2-hybrid screening using the transcriptional coactivator GRIP1 (OMIM Ref. No. 604597) as bait. The putative full-length mouse *Err3* contains 458 amino acids and is closely related to *Err1* and *Err2*. All ERR family

members share an almost identical DNA-binding domain, which shares 68% amino acid identity with that of estrogen receptor. Expression of Err3 in adult mouse was restricted; highest expression was observed in heart, kidney, and brain. In mouse embryo, no expression was observed at day 7, and highest expression occurred around days 11 to 15. Although Err3 is more closely related to Err2 than to Err1, the expression pattern for Err3 was similar to that of Err1 and distinct from that for Err2, suggesting a unique role for Err3 in development. Eudy et al. (1998) mapped the ESRRG gene to the USH2A critical region on chromosome 1q41.

[3372] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3373] Heard, D. J.; Norby, P. L.; Holloway, J.; Vissing, H. : Human ERR-gamma, a third member of the estrogen receptor-related receptor (ERR) subfamily of orphan nuclear receptors: tissue-specific isoforms are expressed during development in the adult. *Molec. Endocr.* 14: 382-392, 2000. ; and

[3374] Eudy, J. D.; Yao, S.; Weston, M. D.; Ma-Edmonds, M.; Talmadge, C. B.; Cheng, J. J.; Kimberling, W. J.; Sumegi, J. :

Isolation of a gene encoding a novel member of the nuclear receptor s.

[3375] Further studies establishing the function and utilities of ESRRG are found in John Hopkins OMIM database record ID 602969, and in cited publications numbered 1916–191 and 1925–1926 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Follistatin–like 1 (FSTL1, Accession NM_007085) is another VGAM119 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:1357, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3376] Another function of VGAM119 is therefore inhibition of Follistatin–like 1 (FSTL1, Accession NM_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1.

The function of FSTL1 has been established by previous studies. Using degenerate primers designed against a peptide purified from a rat glioma cell line, Zwijsen et al. (1994) isolated a full-length follistatin-like cDNA (FSTL1), which they called FRP, from a human glioma cDNA library. FSTL1 encodes a deduced 308-amino acid protein with an N-terminal signal peptide of 20 amino acids. FSTL1 contains an FS module, a follistatin-like sequence containing 10 conserved cysteine residues. The number and distribution of the cysteine residues supports the existence of several intramolecular disulfide bridges. Zwijsen et al. (1994) did not detect any membrane-spanning or membrane-associated sequences in the FSTL1 sequence, but they predicted 3 putative N-glycosylation sites and several phosphorylation sites. Under denaturing conditions, Zwijsen et al. (1994) detected several isoforms of FSTL1 with molecular masses of 40 to 48 kD which differs from the 50- to 55-kD products detected by Tanaka et al. (1998). Tanaka et al. (1998) hypothesized that the difference results from the molecular conditions affected by posttranslational modification. FSTL1 shares greater than 92% amino acid identity with the mouse homolog, known as Fstl or TSC-36, identified as a transforming growth fac-

tor-beta-inducible protein by Shibamura et al. (1993). Zwijsen et al. (1994) also noted sequence similarity to follistatin (OMIM Ref. No. 136470) and agrin (OMIM Ref. No. 103320), and could not detect any effect of FSTL1 on the cell growth inhibition of TGF-beta (OMIM Ref. No. 190180). Using Northern blot analysis, Tanaka et al. (1998) detected a broadly expressed 4.4-kb FSTL1 transcript most strongly in the heart, placenta, prostate, ovary, and small intestine. Expression was not detected in peripheral blood leukocytes. Tanaka et al. (1998) constructed synovium expression cDNA libraries made from rheumatoid arthritis (RA; 180300) patient-derived synovial cell mRNA. By screening the libraries by IgG purified from synovial fluids from RA patients, they identified FSTL1. Using immunoblotting analysis, they detected anti-FSTL1 antibodies as more frequent in the synovial fluids and serum of RA patients than in patients with other systemic rheumatic diseases or in healthy individuals. patients. Immunoprecipitation analysis showed no difference between these groups in the amount of synovial FSTL1 protein, suggesting an elevated turnover in RA.

[3377] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[3378] Tanaka, M.; Ozaki, S.; Osakada, F.; Mori, K.; Okubo, M.; Nakao, K. : Cloning of follistatin-related protein as a novel autoantigen in systemic rheumatic diseases. *Int. Immun.* 10: 1305–1314, 1998. ; and

[3379] Zwijsen, A.; Blockx, H.; van Arnhem, W.; Willems, J.; Fransen, L.; Devos, K.; Raymackers, J.; van de Voorde, A.; Slegers, H. : Characterization of a rat C6 glioma-secreted follistatin-r.

[3380] Further studies establishing the function and utilities of FSTL1 are found in John Hopkins OMIM database record ID 605547, and in cited publications numbered 1489–1491 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gamma-aminobutyric Acid (GABA) A Receptor, Beta 2 (GABRB2, Accession NM_021911) is another VGAM119 host target gene. GABRB2 BINDING SITE1 and GABRB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABRB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRB2 BINDING SITE1 and GABRB2 BINDING SITE2, des-

ignated SEQ ID:1967 and SEQ ID:776 respectively, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3381] Another function of VGAM119 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Beta 2 (GABRB2, Accession NM_021911). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRB2. Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699) is another VGAM119 host target gene. NRIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRIP1 BINDING SITE, designated SEQ ID:2548, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3382] Another function of VGAM119 is therefore inhibition of Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699), a gene which modulates transcriptional activation by the estrogen receptor. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with NRIP1. The function of NRIP1 has been established by previous studies. Cavailles et al. (1995) identified the receptor-interacting protein 140 (OMIM Ref. No. RIP140) by virtue of its direct association with a transcriptional activation domain of the estrogen receptor (ESR; 133430) in the presence of estrogen; by fluorescence in situ hybridization with a cDNA clone, they mapped the gene to 21q11. Katsanis et al. (1998) used hybrids, YACs, and PACs to place the RIP140 gene on the physical map of chromosome 21; 21q11 is a gene-poor region.

[3383] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3384] Cavailles, V.; Dauvois, S.; Horset, L. F.; Lopez, G.; Hoare, S.; Kushner, P. J.; Parker, M. G. : Nuclear factor RIP140 modulates transcriptional activation by the estrogen receptor. EMBO J. 14: 3741–3751, 1995. ; and

[3385] Katsanis, N.; Ives, J. H.; Groet, J.; Nizetic, D.; Fisher, E. M. C. : Localisation of receptor interacting protein 140 (RIP140) within 100 kb of D21S13 on 21q11, a gene-poor region of t.

[3386] Further studies establishing the function and utilities of

NRIP1 are found in John Hopkins OMIM database record ID 602490, and in cited publications numbered 233–234 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Oligophrenin 1 (OPHN1, Accession NM_002547) is another VGAM119 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:936, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3387] Another function of VGAM119 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM_002547). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848) is another VGAM119 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PT–

PRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ ID:964, SEQ ID:2155, SEQ ID:2156, SEQ ID:2157 and SEQ ID:2158 respectively, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3388] Another function of VGAM119 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO has been established by previous studies. To identify protein-tyrosine phosphatases (PTPases) involved in the oncogenic process leading to the development of pancreatic carcinoma, Wang et al. (1996) performed PCR on pooled poly(A)+ RNA from 9 human pancreatic carcinoma cell lines using PTPase consensus oligonucleotide primers. One of the novel PCR products recovered was termed PCP2 (pancreatic carcinoma phosphatase-2) and was used

to screen a human pancreatic adenocarcinoma cDNA library. The full sequence of PCP2 predicts a 1,430 amino acid protein consisting of a putative extracellular domain of 740 amino acids, a single transmembrane domain, and an intracellular domain of 666 amino acids. The intracellular region contains 2 tandemly repeated PTP catalytic domains with a high degree of identity to the catalytic domains of mouse PTP- κ and PTP- μ . In addition to a signal peptide and 13 potential N-linked glycosylation sites, the extracellular domain contains a MAM (meprin/A5/PTP- μ) domain followed by 1 Ig-like repeat and 4 putative fibronectin type III repeats. The MAM domain, found in *Xenopus* A5 glycoprotein, meprin A, and meprin B, as well as in PTP- κ and PTP- μ , may be involved in attachment to the cytoskeleton. PCP2, PTP- κ , and PTP- μ appear to form a subfamily of MAM-containing receptor-like PTPs (RPTPs). PCP2 also contains the tripeptide HAV, implicated in cell-cell contact in the cadherins. By Northern blot analysis, Wang et al. (1996) demonstrated that the 5.5-kb PCP2 transcript is widely distributed at varying levels, with very high expression in brain, skeletal muscle, and pancreas, but no expression in placenta or spleen. Wang et al. (1996) demonstrated tyro-

sine phosphatase activity using an in vitro pNPP assay. Subcellular localization using laser scanning immunofluorescence microscopy showed localization of PCP2 at intercellular adhesions and colocalization with beta-catenin and E-cadherin. Wang et al. (1996) hypothesized that PCP2 and other members of this subfamily of RPTPases may function as cell contact receptors that mediate and control cell-cell signals. Wang et al. (1997) used degenerate PCR to clone PTP-J, a member of the type II receptor PTPase family. The PTP-J cDNA encodes a 1,436-amino acid polypeptide that includes a single transmembrane domain and a cytoplasmic domain containing 2 tandemly repeated PTP catalytic domains. The presence of 2 PTP domains indicates that this gene is a member of the type II receptor PTPases. Northern blot analysis detected expression in skeletal muscle, heart, prostate, pancreas, and placenta. Wang et al. (1997) found that in lymphocytes or lymphoma cells, expression of PTP-J is downregulated following stimulation by either phorbol myristate acetate (PMA) or calcium ionophore, suggesting that PMA or calcium signaling pathways may be involved in regulating the expression of PTP-J.

[3389] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [3390] Wang, B.; Kishihara, K.; Zhang, D.; Hara, H.; Nomoto, K. : Molecular cloning and characterization of a novel human receptor protein tyrosine phosphatase gene, hPTP-J: down-regulation of gene expression by PMA and calcium ionophore in Jurkat T lymphoma cells. *Biochem. Biophys. Res. Commun.* 231: 77–81, 1997. ; and
- [3391] Wang, H; Lian, Z; Lerch, M. M.; Chen, Z; Xie, W; Ullrich, A. : Characterization of PCP-2, a novel receptor protein tyrosine phosphatase of the MAM domain family. *Oncogene* 12: 2555–2562.
- [3392] Further studies establishing the function and utilities of PTPRO are found in John Hopkins OMIM database record ID 602454, and in cited publications numbered 1473–1474 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAR-related Orphan Receptor B (RORB, Accession NM_006914) is another VGAM119 host target gene. RORB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RORB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of RORB BINDING SITE, designated SEQ ID:1338, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3393] Another function of VGAM119 is therefore inhibition of RAR-related Orphan Receptor B (RORB, Accession NM_006914), a gene which is an orphan nuclear receptor. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORB. The function of RORB has been established by previous studies. ROR-beta is a transcription factor and belongs to the nuclear receptor family (Carlberg et al., 1994). Members of this superfamily share a common modular structure composed of a transactivation domain, a DNA-binding domain, and a ligand-binding domain (Evans, 1988). Typically, their transcriptional transactivation function is regulated by small lipophilic molecules, such as steroid hormones, vitamin D, retinoic acids, and thyroid hormone. These molecules are synthesized in the organism and pass readily through the plasma membrane to reach the corresponding receptors inside the cell. In addition to the classic hormone receptors, a growing number of nuclear receptors for which no

ligands are known have been identified by homology cloning. These nuclear receptors are referred to as 'orphan' nuclear receptors. ROR-beta is such an orphan nuclear receptor, forming a subfamily with the closely related nuclear receptors ROR-alpha (RORA; 600825) and ROR-gamma (RORC; 602943). Animal model experiments lend further support to the function of RORB. ROR-beta is expressed in areas of the central nervous system that are involved in the processing of sensory information, including spinal cord, thalamus, and sensory cerebellar cortices. Additionally, ROR-beta localizes to the 3 principal anatomic components of the mammalian timing system: the suprachiasmatic nuclei, the retina, and the pineal gland. Andre et al. (1998) showed that RORB mRNA levels oscillate in retina and pineal gland with a circadian rhythm that persists in constant darkness. They generated RORB-deficient mice by gene targeting in embryonic stem cells and analyzed their phenotypic behavior. Rorb $-/-$ mice display a duck-like gait, transient male incapability to reproduce sexually, and a severely disorganized retina that suffers from postnatal degeneration. Consequently, adult Rorb $-/-$ mice are blind, yet their circadian activity rhythm is still entrained by light-dark cycles. Under conditions of

constant darkness, *Rorb* $-/-$ mice display an extended period of free-running rhythmicity. The overall behavioral phenotype of *Rorb* $-/-$ mice, together with the chromosomal localization of the gene on mouse chromosome 4, suggested a close relationship to the spontaneous mouse mutation 'vacillans' described by Sirlin (1956) and now thought to be extinct

[3394] It is appreciated that the abovementioned animal model for RORB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3395] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3396] Evans, R. M. : The steroid and thyroid hormone receptor superfamily. *Science* 240: 889–895, 1988. ; and

[3397] Andre, E.; Conquet, F.; Steinmayr, M.; Stratton, S. C.; Porciatti, V.; Becker-Andre, M. : Disruption of retinoid-related orphan receptor beta changes circadian behavior, causes retinal deg.

[3398] Further studies establishing the function and utilities of RORB are found in John Hopkins OMIM database record ID 601972, and in cited publications numbered 1921,

1922–192 and 1778 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sorbitol Dehydrogenase (SORD, Accession NM_003104) is another VGAM119 host target gene. SORD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SORD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORD BINDING SITE, designated SEQ ID:990, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3399] Another function of VGAM119 is therefore inhibition of Sorbitol Dehydrogenase (SORD, Accession NM_003104). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORD. Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056) is another VGAM119 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:797, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3400] Another function of VGAM119 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C1. Tryptophan Rich Basic Protein (WRB, Accession NM_004627) is another VGAM119 host target gene. WRB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WRB BINDING SITE, designated SEQ ID:1137, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3401] Another function of VGAM119 is therefore inhibition of Tryptophan Rich Basic Protein (WRB, Accession NM_004627). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with WRB. Ankyrin Repeat Domain 5 (ANKRD5, Accession NM_022096) is another VGAM119 host target gene. ANKRD5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ANKRD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKRD5 BINDING SITE, designated SEQ ID:1978, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3402] Another function of VGAM119 is therefore inhibition of Ankyrin Repeat Domain 5 (ANKRD5, Accession NM_022096). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKRD5. Chromosome 7 Open Reading Frame 10 (C7orf10, Accession NM_024728) is another VGAM119 host target gene. C7orf10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C7orf10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

C7orf10 BINDING SITE, designated SEQ ID:2084, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3403] Another function of VGAM119 is therefore inhibition of Chromosome 7 Open Reading Frame 10 (C7orf10, Accession NM_024728). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7orf10. DKFZP727M111 (Accession NM_015540) is another VGAM119 host target gene. DKFZP727M111 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP727M111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727M111 BINDING SITE, designated SEQ ID:1633, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3404] Another function of VGAM119 is therefore inhibition of DKFZP727M111 (Accession NM_015540). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727M111. FLJ13262 (Accession NM_024914) is

another VGAM119 host target gene. FLJ13262 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13262 BINDING SITE, designated SEQ ID:2113, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3405] Another function of VGAM119 is therefore inhibition of FLJ13262 (Accession NM_024914). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13262. FLJ20425 (Accession NM_017816) is another VGAM119 host target gene. FLJ20425 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20425 BINDING SITE, designated SEQ ID:1755, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3406] Another function of VGAM119 is therefore inhibition of FLJ20425 (Accession NM_017816). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20425. KIAA0953 (Accession XM_039733) is another VGAM119 host target gene. KIAA0953 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:2763, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3407] Another function of VGAM119 is therefore inhibition of KIAA0953 (Accession XM_039733). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953. KIAA1450 (Accession XM_038035) is another VGAM119 host target gene. KIAA1450 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1450, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1450 BINDING SITE, designated SEQ ID:2732, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3408] Another function of VGAM119 is therefore inhibition of KIAA1450 (Accession XM_038035). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1450. Neurogenic Differentiation 6 (NEUROD6, Accession NM_022728) is another VGAM119 host target gene. NEUROD6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NEUROD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEUROD6 BINDING SITE, designated SEQ ID:2000, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3409] Another function of VGAM119 is therefore inhibition of Neurogenic Differentiation 6 (NEUROD6, Accession NM_022728). Accordingly, utilities of VGAM119 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NEUROD6. PRO0255 (Accession NM_014124) is another VGAM119 host target gene. PRO0255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0255 BINDING SITE, designated SEQ ID:1475, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3410] Another function of VGAM119 is therefore inhibition of PRO0255 (Accession NM_014124). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0255. UBE3B (Accession XM_084941) is another VGAM119 host target gene. UBE3B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UBE3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3B BINDING SITE, designated SEQ

ID:3069, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3411] Another function of VGAM119 is therefore inhibition of UBE3B (Accession XM_084941). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3B. Zinc Finger, Imprinted 2 (ZIM2, Accession NM_015363) is another VGAM119 host target gene. ZIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIM2 BINDING SITE, designated SEQ ID:1623, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3412] Another function of VGAM119 is therefore inhibition of Zinc Finger, Imprinted 2 (ZIM2, Accession NM_015363). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIM2. LOC112868 (Accession XM_053402) is another VGAM119 host target gene. LOC112868 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:2962, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3413] Another function of VGAM119 is therefore inhibition of LOC112868 (Accession XM_053402). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC116166 (Accession XM_007651) is another VGAM119 host target gene. LOC116166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116166 BINDING SITE, designated SEQ ID:2545, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3414] Another function of VGAM119 is therefore inhibition of

LOC116166 (Accession XM_007651). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116166. LOC123855 (Accession XM_063871) is another VGAM119 host target gene. LOC123855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC123855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123855 BINDING SITE, designated SEQ ID:3033, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3415] Another function of VGAM119 is therefore inhibition of LOC123855 (Accession XM_063871). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123855. LOC146818 (Accession XM_085598) is another VGAM119 host target gene. LOC146818 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146818 BINDING SITE, designated SEQ ID:3100, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3416] Another function of VGAM119 is therefore inhibition of LOC146818 (Accession XM_085598). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146818. LOC152190 (Accession XM_045692) is another VGAM119 host target gene. LOC152190 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152190 BINDING SITE, designated SEQ ID:2864, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3417] Another function of VGAM119 is therefore inhibition of LOC152190 (Accession XM_045692). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152190. LOC153077 (Accession XM_098307) is an-

other VGAM119 host target gene. LOC153077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:3366, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3418] Another function of VGAM119 is therefore inhibition of LOC153077 (Accession XM_098307). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077. LOC158382 (Accession XM_098931) is another VGAM119 host target gene. LOC158382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158382 BINDING SITE, designated SEQ ID:3388, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3419] Another function of VGAM119 is therefore inhibition of LOC158382 (Accession XM_098931). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158382. LOC158476 (Accession XM_098955) is another VGAM119 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:3391, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3420] Another function of VGAM119 is therefore inhibition of LOC158476 (Accession XM_098955). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. LOC164397 (Accession XM_092780) is another VGAM119 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:3249, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3421] Another function of VGAM119 is therefore inhibition of LOC164397 (Accession XM_092780). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164397. LOC196510 (Accession XM_113738) is another VGAM119 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:3416, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3422] Another function of VGAM119 is therefore inhibition of LOC196510 (Accession XM_113738). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196510. LOC200220 (Accession XM_114157) is another VGAM119 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:3445, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3423] Another function of VGAM119 is therefore inhibition of LOC200220 (Accession XM_114157). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200220. LOC201477 (Accession XM_117098) is another VGAM119 host target gene. LOC201477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201477 BINDING SITE, designated SEQ ID:3472, to the nucleotide sequence of VGAM119 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:454.

[3424] Another function of VGAM119 is therefore inhibition of LOC201477 (Accession XM_117098). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201477. LOC201696 (Accession XM_032269) is another VGAM119 host target gene. LOC201696 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:2650, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3425] Another function of VGAM119 is therefore inhibition of LOC201696 (Accession XM_032269). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. LOC220469 (Accession XM_084334) is another VGAM119 host target gene. LOC220469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220469, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220469 BINDING SITE, designated SEQ ID:3049, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3426] Another function of VGAM119 is therefore inhibition of LOC220469 (Accession XM_084334). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220469. LOC221272 (Accession XM_168050) is another VGAM119 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:3615, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3427] Another function of VGAM119 is therefore inhibition of LOC221272 (Accession XM_168050). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC221272. LOC222166 (Accession XM_168425) is another VGAM119 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:3636, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3428] Another function of VGAM119 is therefore inhibition of LOC222166 (Accession XM_168425). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC253220 (Accession XM_172831) is another VGAM119 host target gene. LOC253220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253220 BINDING SITE, designated SEQ ID:3706, to

the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3429] Another function of VGAM119 is therefore inhibition of LOC253220 (Accession XM_172831). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253220. LOC51275 (Accession NM_016534) is another VGAM119 host target gene. LOC51275 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51275 BINDING SITE, designated SEQ ID:1694, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3430] Another function of VGAM119 is therefore inhibition of LOC51275 (Accession NM_016534). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51275. LOC54505 (Accession XM_042110) is another VGAM119 host target gene. LOC54505 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC54505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54505 BINDING SITE, designated SEQ ID:2800, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3431] Another function of VGAM119 is therefore inhibition of LOC54505 (Accession XM_042110). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54505. LOC90844 (Accession XM_034434) is another VGAM119 host target gene. LOC90844 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90844 BINDING SITE, designated SEQ ID:2682, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3432] Another function of VGAM119 is therefore inhibition of LOC90844 (Accession XM_034434). Accordingly, utilities

of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90844. LOC92697 (Accession XM_046715) is another VGAM119 host target gene. LOC92697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE, designated SEQ ID:2882, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:454.

[3433] Another function of VGAM119 is therefore inhibition of LOC92697 (Accession XM_046715). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92697. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 120 (VGAM120) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3434] VGAM120 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM120 was detected is described hereinabove with reference to Figs. 1–8.

[3435] VGAM120 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM120 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3436] VGAM120 gene encodes a VGAM120 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM120 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM120 precursor RNA is designated SEQ ID:106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:106 is located at position 50332 relative to the genome of Vaccinia Virus.

[3437] VGAM120 precursor RNA folds onto itself, forming VGAM120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3438] An enzyme complex designated DICER COMPLEX, `dices` the VGAM120 folded precursor RNA into VGAM120 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM120 RNA is designated SEQ ID:455, and is provided hereinbelow with reference to the sequence listing part.

[3439] VGAM120 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM120 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[3440] VGAM120 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM120 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM120 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3441] The complementary binding of VGAM120 RNA, herein designated VGAM RNA, to host target binding sites on VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM120 host target RNA into VGAM120 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3442] It is appreciated that VGAM120 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM120 host target genes. The mRNA of each one of this plurality of VGAM120 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM120 RNA, herein designated VGAM RNA, and which when bound by VGAM120 RNA causes inhibition of translation of respective one or more VGAM120 host target proteins.

[3443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM120 gene, herein designated VGAM GENE, on one or more VGAM120 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3444] It is yet further appreciated that a function of VGAM120 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM120 correlate with, and may be deduced from, the identity of the host target genes which VGAM120 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3445] Nucleotide sequences of the VGAM120 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM120 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM120 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM120 are further
described hereinbelow with reference to Table 1.

[3446] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM120 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM120 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[3447] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM120 gene, herein designated VGAM is
inhibition of expression of VGAM120 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM120 correlate with, and may be deduced
from, the identity of the target genes which VGAM120
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[3448] Kinesin Family Member 5C (KIF5C, Accession NM_004522)
is a VGAM120 host target gene. KIF5C BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:1122, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:455.

[3449] A function of VGAM120 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM_004522). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. DKFZP564M182 (Accession XM_085525) is another VGAM120 host target gene. DKFZP564M182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564M182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564M182 BINDING SITE, designated SEQ ID:3097, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:455.

[3450] Another function of VGAM120 is therefore inhibition of DKFZP564M182 (Accession XM_085525). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564M182. KIAA0852 (Accession NM_014941) is another VGAM120 host target gene. KIAA0852 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0852 BINDING SITE, designated SEQ ID:1594, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:455.

[3451] Another function of VGAM120 is therefore inhibition of KIAA0852 (Accession NM_014941). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0852. PRO0097 (Accession NM_014114) is another VGAM120 host target gene. PRO0097 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0097 BINDING SITE, designated SEQ ID:1472, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:455.

[3452] Another function of VGAM120 is therefore inhibition of PRO0097 (Accession NM_014114). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0097. LOC222161 (Accession XM_166596) is another VGAM120 host target gene. LOC222161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222161 BINDING SITE, designated SEQ ID:3578, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:455.

[3453] Another function of VGAM120 is therefore inhibition of LOC222161 (Accession XM_166596). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222161. LOC255811 (Accession XM_170625) is another VGAM120 host target gene. LOC255811 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255811 BINDING SITE, designated SEQ ID:3662, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:455.

[3454] Another function of VGAM120 is therefore inhibition of LOC255811 (Accession XM_170625). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255811. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 121 (VGAM121) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3455] VGAM121 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM121 was detected is described hereinabove with reference to Figs. 1–8.

[3456] VGAM121 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM121 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3457] VGAM121 gene encodes a VGAM121 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM121 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM121 precursor RNA is designated SEQ ID:107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:107 is located at position 47859 relative to the genome of Vaccinia Virus.

[3458] VGAM121 precursor RNA folds onto itself, forming VGAM121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3459] An enzyme complex designated DICER COMPLEX, `dices` the VGAM121 folded precursor RNA into VGAM121 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM121 RNA is designated SEQ ID:456, and is provided hereinbelow with reference to the sequence listing part.

[3460] VGAM121 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM121 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM121 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3461] VGAM121 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM121 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM121 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM121 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM121 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[3462] The complementary binding of VGAM121 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM121 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM121 host target RNA into VGAM121 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3463] It is appreciated that VGAM121 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM121 host target genes. The mRNA of each one of this plurality of VGAM121 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM121 RNA, herein designated VGAM RNA, and which when bound by VGAM121 RNA causes inhibition of translation of respective one or more VGAM121 host target proteins.

[3464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM121 gene, herein designated VGAM GENE, on one or more VGAM121 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3465] It is yet further appreciated that a function of VGAM121 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM121 correlate with, and may be deduced from, the identity of the host target genes which VGAM121 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3466] Nucleotide sequences of the VGAM121 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM121 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM121 are further described hereinbelow with reference to Table 1.

[3467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM121 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM121 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3468] As mentioned hereinabove with reference to Fig. 1, a function of VGAM121 gene, herein designated VGAM is inhibition of expression of VGAM121 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM121 correlate with, and may be deduced from, the identity of the target genes which VGAM121 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3469] Dihydropyrimidine Dehydrogenase (DPYD, Accession XM_017469) is a VGAM121 host target gene. DPYD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYD, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYD BINDING SITE, designated SEQ ID:2569, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:456.

[3470] A function of VGAM121 is therefore inhibition of Dihydropyrimidine Dehydrogenase (DPYD, Accession XM_017469). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYD. KIAA1240 (Accession XM_039676) is another VGAM121 host target gene. KIAA1240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1240 BINDING SITE, designated SEQ ID:2761, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:456.

[3471] Another function of VGAM121 is therefore inhibition of KIAA1240 (Accession XM_039676). Accordingly, utilities

of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1240. KIAA1843 (Accession XM_030838) is another VGAM121 host target gene. KIAA1843 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1843 BINDING SITE, designated SEQ ID:2624, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:456.

[3472] Another function of VGAM121 is therefore inhibition of KIAA1843 (Accession XM_030838). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1843. LOC122786 (Accession XM_058660) is another VGAM121 host target gene. LOC122786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC122786 BINDING SITE, designated SEQ ID:2995, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:456.

[3473] Another function of VGAM121 is therefore inhibition of LOC122786 (Accession XM_058660). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122786. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 122 (VGAM122) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3474] VGAM122 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM122 was detected is described hereinabove with reference to Figs. 1–8.

[3475] VGAM122 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM122 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3476] VGAM122 gene encodes a VGAM122 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM122 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM122 precursor RNA is designated SEQ ID:108, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:108 is located at position 50837 relative to the genome of Vaccinia Virus.

[3477] VGAM122 precursor RNA folds onto itself, forming VGAM122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3478] An enzyme complex designated DICER COMPLEX, `dices` the VGAM122 folded precursor RNA into VGAM122 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM122 RNA is designated SEQ ID:457, and is provided hereinbelow with reference to the sequence listing part.

[3479] VGAM122 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM122 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[3480] VGAM122 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM122 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM122 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3481] The complementary binding of VGAM122 RNA, herein designated VGAM RNA, to host target binding sites on VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM122 host target RNA into VGAM122 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3482] It is appreciated that VGAM122 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM122 host target genes. The mRNA of each one of this plurality of VGAM122 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM122 RNA, herein designated VGAM RNA, and which when bound by VGAM122 RNA causes inhibition of translation of respective one or more VGAM122 host target proteins.

[3483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM122 gene, herein designated VGAM GENE, on one or more VGAM122 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[3484] It is yet further appreciated that a function of VGAM122 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM122 correlate with, and may be deduced from, the identity of the host target genes which VGAM122 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3485] Nucleotide sequences of the VGAM122 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM122 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM122 are further described hereinbelow with reference to Table 1.

[3486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM122 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM122 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3487] As mentioned hereinabove with reference to Fig. 1, a function of VGAM122 gene, herein designated VGAM is inhibition of expression of VGAM122 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM122 correlate with, and may be deduced from, the identity of the target genes which VGAM122 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3488] Fibroblast Growth Factor 12 (FGF12, Accession NM_021032) is a VGAM122 host target gene. FGF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF12 BINDING SITE, designated SEQ ID:1935, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3489] A function of VGAM122 is therefore inhibition of Fibrob-

last Growth Factor 12 (FGF12, Accession NM_021032), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF12. The function of FGF12 has been established by previous studies. Fibroblast growth factors comprise a family of related polypeptides with broad mitogenic and cell survival activities. Smallwood et al. (1996) noted that FGF1 (OMIM Ref. No. 131220), or acidic FGF, and FGF2 (OMIM Ref. No. 134920), or basic FGF, were the first 2 family members to be identified, purified, and sequenced, and are widely expressed as a potent mitogen for a variety of cell types. FGF3 (OMIM Ref. No. 164950) is a common target for activation by the mouse mammary tumor virus. The genes encoding FGF4 (OMIM Ref. No. 164980), FGF5 (OMIM Ref. No. 165190), and FGF6 (OMIM Ref. No. 134921) have transforming activity when introduced into NIH 3T3 cells. FGF7 (OMIM Ref. No. 148180), FGF8 (OMIM Ref. No. 600483), and FGF9 (OMIM Ref. No. 600921) are mitogens for keratinocytes, mammary carcinoma cells, and astrocytes, respectively. Several FGFs have been found to have additional bioactivities that were not evident during their initial identification.

The 9 known FGFs are between 150 and 268 amino acid residues in length and share a conserved central region of approximately 140 amino acids. FGF signaling is generally assumed to occur by activation of transmembrane tyrosine kinase receptors. Four FGF receptors, FGFR1 (OMIM Ref. No. 136350) through FGFR4 (OMIM Ref. No. 134935), had been identified, and activating or inactivating receptor mutations have been described for a subset of these genes in both mice and humans. Smallwood et al. (1996) identified and characterized 4 additional members of the FGF family, which they referred to as fibroblast growth factor homologous factors (FHF). The genes were identified by a combination of random cDNA sequencing, database searches, and degenerate PCR. Pairwise comparisons between the 4 FHF show between 58% and 71% amino acid sequence identity, but each FHF shows less than 30% identity when compared with other FGFs. Like FGF1 and FGF2, the FHF lack a classic signal sequence and contain clusters of basic residues that can act as nuclear localization signals. In transiently transfected 293 cells, FHF1 accumulates in the nucleus and is not secreted. By Southern blot hybridization of genomic DNA from rodent/human hybrid cell lines containing individual

human chromosomes, Smallwood et al. (1996) demonstrated that the human FHF1 (also symbolized FGF12), FHF2 (OMIM Ref. No. 300070), FHF3 (OMIM Ref. No. 601514), and FHF4 (OMIM Ref. No. 601515) genes are located on chromosomes 3, X, 17, and 13, respectively. They found that a sequence tagged site (STS) that encompassed 1 exon of FHF3 was derived from human chromosome 17 and mapped near the BRCA1 gene (OMIM Ref. No. 113705), which is located at 17q21. The chromosomal locations of Fhf1, Fhf2, and Fhf4 in the mouse were determined using an interspecific mapping panel. Fhf1 mapped to the proximal region of mouse chromosome 16, 1.6 cM distal to somatostatin (OMIM Ref. No. 182450) and 5.1 cM proximal to ApoD (OMIM Ref. No. 107740). Fhf2 mapped to the mouse X chromosome and did not recombine with the CD40 ligand gene (OMIM Ref. No. 300386) in 168 mice typed, suggesting that the 2 loci are within 1.8 cM of each other. Fhf4 mapped to the distal region of chromosome 14 and did not recombine with Rap2a (OMIM Ref. No. 179540) in 142 mice typed in common. The Fhf3 gene was not mapped with the backcross panel because it failed to demonstrate an informative RFLP when tested with 14 restriction enzymes. The proximity of

the human FHF3 gene to BRCA1 suggested to Smallwood et al. (1996) that the mouse homolog resides on chromosome 11 in the region that is syntenic with the BRCA1 region of human chromosome 17. From the location of the Fhf1 gene in the mouse one can suggest that the human gene is located on 3q28. Smallwood et al. (1996) showed that FHF3s are expressed principally in the nervous system and are therefore likely to play a role in nervous system development and/or function. Liu and Chiu (1997) mapped the FGF12 gene to 3q29–qter by fluorescence in situ hybridization.

- [3490] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [3491] Liu, Y.; Chiu, I.-M. : Assignment of FGF12, the human FGF homologous factor 1 gene, to chromosome 3q29–3qter by fluorescence in situ hybridization. Cytogenet. Cell Genet. 78: 48–49, 1997. ; and
- [3492] Smallwood, P. M.; Munoz–Sanjuan, I.; Tong, P.; Macke, J. P.; Hendry, S. H. C.; Gilbert, D. J.; Copeland, N. G.; Jenkins, N. A.; Nathans, J. : Fibroblast growth factor (FGF) homologous f.
- [3493] Further studies establishing the function and utilities of

FGF12 are found in John Hopkins OMIM database record ID 601513, and in cited publications numbered 64 and 2039 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibrinogen, Gamma Polypeptide (FGG, Accession NM_021870) is another VGAM122 host target gene. FGG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGG BINDING SITE, designated SEQ ID:1965, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3494] Another function of VGAM122 is therefore inhibition of Fibrinogen, Gamma Polypeptide (FGG, Accession NM_021870). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGG. NEBL (Accession NM_006393) is another VGAM122 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:1295, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3495] Another function of VGAM122 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL. Ribulose-5-phosphate-3-epimerase (RPE, Accession XM_030834) is another VGAM122 host target gene. RPE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPE BINDING SITE, designated SEQ ID:2623, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3496] Another function of VGAM122 is therefore inhibition of Ribulose-5-phosphate-3-epimerase (RPE, Accession XM_030834). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RPE. TRHDE (Accession NM_013381) is another VGAM122 host target gene. TRHDE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRHDE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRHDE BINDING SITE, designated SEQ ID:1446, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3497] Another function of VGAM122 is therefore inhibition of TRHDE (Accession NM_013381). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRHDE. BCMP1 (Accession NM_031442) is another VGAM122 host target gene. BCMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:2197, to the nucleotide sequence of VGAM122 RNA,

herein designated VGAM RNA, also designated SEQ ID:457.

[3498] Another function of VGAM122 is therefore inhibition of BCMP1 (Accession NM_031442). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. DKFZP434A0225 (Accession XM_168185) is another VGAM122 host target gene. DKFZP434A0225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434A0225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A0225 BINDING SITE, designated SEQ ID:3624, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3499] Another function of VGAM122 is therefore inhibition of DKFZP434A0225 (Accession XM_168185). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A0225. FLJ12899 (Accession NM_024594) is another VGAM122 host target gene. FLJ12899 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12899 BINDING SITE, designated SEQ ID:2069, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3500] Another function of VGAM122 is therefore inhibition of FLJ12899 (Accession NM_024594). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12899. Preimplantation Protein 3 (PREI3, Accession XM_038960) is another VGAM122 host target gene. PREI3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PREI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PREI3 BINDING SITE, designated SEQ ID:2747, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3501] Another function of VGAM122 is therefore inhibition of

Preimplantation Protein 3 (PREI3, Accession XM_038960). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PREI3. PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222) is another VGAM122 host target gene. PSIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSIP2 BINDING SITE, designated SEQ ID:2323, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3502] Another function of VGAM122 is therefore inhibition of PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSIP2. LOC220963 (Accession XM_166145) is another VGAM122 host target gene. LOC220963 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220963, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:3526, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:457.

[3503] Another function of VGAM122 is therefore inhibition of LOC220963 (Accession XM_166145). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 123 (VGAM123) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3504] VGAM123 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM123 was detected is described hereinabove with reference to Figs. 1–8.

[3505] VGAM123 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM123 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3506] VGAM123 gene encodes a VGAM123 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM123 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM123 precursor RNA is designated SEQ ID:109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:109 is located at position 52454 relative to the genome of Vaccinia Virus.

[3507] VGAM123 precursor RNA folds onto itself, forming VGAM123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3508] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM123 folded precursor RNA into VGAM123 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM123 RNA is designated SEQ ID:458, and is provided hereinbelow with reference to the sequence listing part.

[3509] VGAM123 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM123 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM123 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3510] VGAM123 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM123 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM123 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM123 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM123 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3511] The complementary binding of VGAM123 RNA, herein designated VGAM RNA, to host target binding sites on VGAM123 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM123 host target RNA into VGAM123 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3512] It is appreciated that VGAM123 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM123 host target genes. The mRNA of each one of this plurality of VGAM123 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM123 RNA, herein designated VGAM RNA, and which when bound by VGAM123 RNA causes inhibition of translation of respective one or more VGAM123 host target proteins.

[3513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM123 gene, herein designated VGAM GENE, on one or more VGAM123 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3514] It is yet further appreciated that a function of VGAM123 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM123 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM123 correlate with, and may be deduced from, the identity of the host target genes which VGAM123 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3515] Nucleotide sequences of the VGAM123 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM123 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM123 are further described hereinbelow with reference to Table 1.

- [3516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM123 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM123 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [3517] As mentioned hereinabove with reference to Fig. 1, a function of VGAM123 gene, herein designated VGAM is inhibition of expression of VGAM123 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM123 correlate with, and may be deduced from, the identity of the target genes which VGAM123 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [3518] LOC143098 (Accession XM_084421) is a VGAM123 host target gene. LOC143098 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143098 BINDING SITE, designated SEQ ID:3051, to the nucleotide sequence of

VGAM123 RNA, herein designated VGAM RNA, also designated SEQ ID:458.

[3519] A function of VGAM123 is therefore inhibition of LOC143098 (Accession XM_084421). Accordingly, utilities of VGAM123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143098. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 124 (VGAM124) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3520] VGAM124 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM124 was detected is described hereinabove with reference to Figs. 1–8.

[3521] VGAM124 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3522] VGAM124 gene encodes a VGAM124 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM124 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM124 precursor RNA is designated SEQ ID:110, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:110 is located at position 52549 relative to the genome of Vaccinia Virus.

[3523] VGAM124 precursor RNA folds onto itself, forming VGAM124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3524] An enzyme complex designated DICER COMPLEX, `dices` the VGAM124 folded precursor RNA into VGAM124 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM124 RNA is designated SEQ ID:459, and is provided hereinbelow with reference to the sequence listing part.

[3525] VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM124 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3526] VGAM124 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM124 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM124 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3527] The complementary binding of VGAM124 RNA, herein designated VGAM RNA, to host target binding sites on VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM124 host target RNA into VGAM124 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3528] It is appreciated that VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM124 host target genes. The mRNA of each one of this plurality of VGAM124 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM124 RNA, herein designated VGAM RNA, and which when bound by VGAM124 RNA causes inhibition of translation of respective one or more VGAM124 host target proteins.

[3529] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM124 gene, herein designated VGAM GENE, on one or more VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[3530] It is yet further appreciated that a function of VGAM124 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM124 correlate with, and may be deduced from, the identity of the host target genes which VGAM124 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[3531] Nucleotide sequences of the VGAM124 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM124 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM124 are further described hereinbelow with reference to Table 1.

[3532] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM124 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM124 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3533] As mentioned hereinabove with reference to Fig. 1, a function of VGAM124 gene, herein designated VGAM is inhibition of expression of VGAM124 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM124 correlate with, and may be deduced from, the identity of the target genes which VGAM124 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3534] Calbindin 2, 29kDa (calretinin) (CALB2, Accession NM_001740) is a VGAM124 host target gene. CALB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALB2 BINDING SITE, designated SEQ ID:853, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3535] A function of VGAM124 is therefore inhibition of Calbindin 2, 29kDa (calretinin) (CALB2, Accession NM_001740), a

gene which plays a major role at the network level in cerebellar physiology. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALB2. The function of CALB2 has been established by previous studies. Using a genomic fragment containing exon 2 of the brain calcium-binding protein, calbindin 29 kD, in the study of human/rodent somatic cell hybrids, Parmentier et al. (1989) assigned the gene to chromosome 16. Chen et al. (1991) mapped the CALB2 gene and 11 others to the long arm of chromosome 16 by the use of 14 mouse/human hybrid cell lines and the fragile site FRA16B. The CALB2 gene was found to be in the distal portion of band 16q22.1, just proximal to HP (OMIM Ref. No. 140100) and just distal to NMOR1 (DIA4; 125860). By in situ hybridization, Parmentier et al. (1991) mapped the CALB2 gene, called by them calretinin, to 16q22-q23. Schiffmann et al. (1999) showed that Calb2-deficient mice were impaired in tests of motor coordination. Impairment in intracellular calcium concentration in the Calb2-deficient Purkinje cells was supported by the high calcium saturation of calbindin-D28K (CALB1; 114050) in these cells. The firing behavior of Purkinje cells was severely affected in alert

null mice, with alterations of simple spike firing rate, complex spike duration, and simple spike pause. In contrast, transmission at parallel fiber– or climbing fiber–Purkinje cell synapses was unaltered in slices, indicating that marked modifications of firing behavior in vivo can be undetectable in slice. The results were interpreted as indicating that CALB2 plays a major role at the network level in cerebellar physiology.

[3536] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3537] Schiffmann, S. N.; Cheron, G.; Lohof, A.; d'Alcantara, P.; Meyer, M.; Parmentier, M.; Schurmans, S. : Impaired motor coordination and Purkinje cell excitability in mice lacking calretinin. *Proc. Nat. Acad. Sci.* 96: 5257–5262, 1999. ; and

[3538] Chen, L. Z.; Harris, P. C.; Apostolou, S.; Baker, E.; Holman, K.; Lane, S. A.; Nancarrow, J. K.; Whitmore, S. A.; Stallings, R. L.; Hildebrand, C. E.; Richards, R. I.; Sutherland, G. R.

[3539] Further studies establishing the function and utilities of CALB2 are found in John Hopkins OMIM database record ID 114051, and in cited publications numbered 2743–406 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619) is another VGAM124 host target gene. TRAF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF5 BINDING SITE, designated SEQ ID:1133, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3540] Another function of VGAM124 is therefore inhibition of TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5. The function of TRAF5 has been established by previous studies. Tumor necrosis factor (TNF; 191160) receptor-associated factors (TRAFs) are signal transducers for members of the TNF receptor superfamily (see OMIM Ref. No. 191190). TRAF proteins are composed of an N-terminal cysteine/

histidine-rich region containing zinc RING and/or zinc finger motifs, a coiled coil (leucine zipper) motif, and a homologous region in the C terminus that defines the TRAF family, the TRAF domain. The TRAF domain is involved in self-association and receptor binding. By degenerative oligonucleotide PCR amplification, Nakano et al. (1996) identified TRAF5 in the mouse and showed that it specifically interacts with the lymphotoxin-beta receptor (OMIM Ref. No. 600979) and activates the transcription factor NF-kappa-B (see OMIM Ref. No. 164011). Nakano et al. (1997) cloned the human TRAF homolog by cross hybridization with mouse TRAF5 cDNA. Their human cDNA of 2,894 bp has a 557-amino acid open reading frame that exhibits 77.5 and 80% identity to mouse TRAF5 at the nucleotide and amino acid levels, respectively. Northern blot analysis revealed that human TRAF5 mRNA is expressed in all visceral organs. Western blotting revealed that the human protein is abundantly expressed in a human follicular dendritic cell line, and to a lesser degree in several tumor cell lines. By in vitro binding, immunoprecipitation, immunoblot, and yeast 2-hybrid analyses, Aizawa et al. (1997) showed that TRAF2 (OMIM Ref. No. 601895) and TRAF5 interact with overlapping but dis-

tinct sequences in the C-terminal region of CD30 (OMIM Ref. No. 153243) and mediate the activation of NFκB. By interspecific backcross mapping, Nakano et al. (1997) showed that Traf5 is located in the distal region of mouse chromosome 1, which shares homology with human 1q. Fluorescence in situ hybridization confirmed the regional localization of human TRAF5 to chromosome 1q32. To investigate the functional role of Traf5 in vivo, Nakano et al. (1999) generated Traf5-deficient mice by gene targeting. They found that Traf5 $-/-$ B lymphocytes show defects in proliferation and upregulation of various surface molecules, including CD23 (OMIM Ref. No. 151445), CD54 (OMIM Ref. No. 147840), CD80 (OMIM Ref. No. 112203), CD86 (OMIM Ref. No. 601020), and FAS (OMIM Ref. No. 134637) in response to CD40 (OMIM Ref. No. 109535) stimulation. Moreover, in vitro Ig production by Traf5 $-/-$ T lymphocytes stimulated with anti-CD40 plus IL4 (OMIM Ref. No. 147780) was reduced substantially. CD27-mediated costimulatory signal also was impaired in Traf5 $-/-$ T lymphocytes. Collectively, these results demonstrated that Traf5 is involved in CD40- and CD27-mediated signaling.

[3541] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [3542] Nakano, H.; Sakon, S.; Koseki, H.; Takemori, T.; Tada, K.; Matsumoto, M.; Munechika, E.; Sakai, T.; Shirasawa, T.; Akiba, H.; Kobata, T.; Santee, S. M.; Ware, C. F.; Renner, P. D.; Taniguchi, M.; Yagita, H.; Okumura, K. : Targeted disruption of Traf5 gene causes defects in CD40- and CD27-mediated lymphocyte activation. Proc. Nat. Acad. Sci. 96: 9803-9808, 1999. ; and

- [3544] Further studies establishing the function and utilities of TRAF5 are found in John Hopkins OMIM database record ID 602356, and in cited publications numbered 2665-2019 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944) is another VGAM124 host target gene. C15orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C15orf5, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C15orf5 BINDING SITE, designated SEQ ID:2173, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3545] Another function of VGAM124 is therefore inhibition of Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf5. DKFZp761K1423 (Accession NM_018422) is another VGAM124 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:1826, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3546] Another function of VGAM124 is therefore inhibition of

DKFZp761K1423 (Accession NM_018422). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. FLJ12892 (Accession XM_042173) is another VGAM124 host target gene. FLJ12892 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12892 BINDING SITE, designated SEQ ID:2801, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3547] Another function of VGAM124 is therefore inhibition of FLJ12892 (Accession XM_042173). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12892. MGC15437 (Accession NM_032873) is another VGAM124 host target gene. MGC15437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MGC15437 BINDING SITE, designated SEQ ID:2292, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3548] Another function of VGAM124 is therefore inhibition of MGC15437 (Accession NM_032873). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15437. MGC27016 (Accession NM_144979) is another VGAM124 host target gene. MGC27016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC27016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC27016 BINDING SITE, designated SEQ ID:2503, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3549] Another function of VGAM124 is therefore inhibition of MGC27016 (Accession NM_144979). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27016. LOC154089 (Accession XM_087846) is an-

other VGAM124 host target gene. LOC154089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154089 BINDING SITE, designated SEQ ID:3187, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3550] Another function of VGAM124 is therefore inhibition of LOC154089 (Accession XM_087846). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154089. LOC159053 (Accession XM_099021) is another VGAM124 host target gene. LOC159053 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159053 BINDING SITE, designated SEQ ID:3395, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:459.

[3551] Another function of VGAM124 is therefore inhibition of LOC159053 (Accession XM_099021). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159053. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 125 (VGAM125) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3552] VGAM125 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM125 was detected is described hereinabove with reference to Figs. 1–8.

[3553] VGAM125 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3554] VGAM125 gene encodes a VGAM125 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM125

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM125 precursor RNA is designated SEQ ID:111, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:111 is located at position 55395 relative to the genome of Vaccinia Virus.

[3555] VGAM125 precursor RNA folds onto itself, forming VGAM125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3556] An enzyme complex designated DICER COMPLEX, `dices` the VGAM125 folded precursor RNA into VGAM125 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 91%) nucleotide sequence of VGAM125 RNA is designated SEQ ID:460, and is provided hereinbelow with reference to the sequence listing part.

[3557] VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM125 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3558] VGAM125 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM125 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM125 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3559] The complementary binding of VGAM125 RNA, herein designated VGAM RNA, to host target binding sites on VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM125 host target RNA into VGAM125 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3560] It is appreciated that VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM125 host target genes. The mRNA of each one of this plurality of VGAM125 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM125 RNA, herein designated VGAM RNA, and which when bound by VGAM125 RNA causes inhibition of translation of respective one or more VGAM125 host target proteins.

[3561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM125 gene, herein designated VGAM GENE, on one or more VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3562] It is yet further appreciated that a function of VGAM125 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM125 correlate with, and may be deduced from, the identity of the host target genes which VGAM125 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3563] Nucleotide sequences of the VGAM125 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM125 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM125 are further described hereinbelow with reference to Table 1.

[3564] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM125 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM125 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[3565] As mentioned hereinabove with reference to Fig. 1, a function of VGAM125 gene, herein designated VGAM is inhibition of expression of VGAM125 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM125 correlate with, and may be deduced from, the identity of the target genes which VGAM125 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3566] Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM_004736) is a VGAM125 host target gene. XPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPR1 BINDING SITE, designated SEQ ID:1152, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:460.

[3567] A function of VGAM125 is therefore inhibition of Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM_004736), a gene which is a putative G protein-coupled receptor and a target for xenotropic and

polytropic murine leukemia retroviruses. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPR1. The function of XPR1 has been established by previous studies. There are 4 classes of murine leukemia virus (MLV): xenotropic (X), ecotropic (E), amphotropic (A), and polytropic (P). X- and E-MLV cannot exogenously infect mouse cells and are inherited as part of the mouse genome. While X-MLV can infect other mammalian species but not cells from laboratory mice, A- (see OMIM Ref. No. SLC20A2; 158378) and P-MLV can infect mouse and other species. See Levy (1999) for a review of MLVs. By cloning a human T-lymphocyte cDNA library into a retroviral vector, transducing the library into naturally X-MLV-resistant mouse fibroblasts, and PCR amplification, Taylor et al. (1999) isolated a cDNA encoding XPR1. Expression of XPR1 in mouse and hamster MLV-resistant fibroblasts rendered the cells susceptible to both X- and P-MLV. The deduced 696-amino acid XPR1 protein contains 8 or 9 potential membrane-spanning regions, 7 potential N-glycosylation sites, and 7 dileucines that may stimulate endocytosis via clathrin-coated pits. Northern blot analysis detected a 4.5-kb XPR1 transcript in all tissues tested,

with highest expression in pancreas, kidney, placenta, hematopoietic tissues, and heart, and lowest expression in skeletal muscle. Expression of XPR1 was greater in fetal liver than adult liver. A 9.5-kb XPR1 transcript was also detected in all tissues tested except liver and bone marrow.

[3568] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3569] Levy, J. A. : Xenotropism: the elusive viral receptor finally uncovered. *Proc. Nat. Acad. Sci.* 96: 802–804, 1999. ; and

[3570] Tailor, C. S.; Nouri, A.; Lee, C. G.; Kozak, C.; Kabat, D. : Cloning and characterization of a cell surface receptor for xenotropic and polytropic murine leukemia viruses. *Proc. Nat. Aca.*

[3571] Further studies establishing the function and utilities of XPR1 are found in John Hopkins OMIM database record ID 605237, and in cited publications numbered 1685–1688 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 126 (VGAM126)

viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3572] VGAM126 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM126 was detected is described hereinabove with reference to Figs. 1–8.

[3573] VGAM126 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3574] VGAM126 gene encodes a VGAM126 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM126 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM126 precursor RNA is designated SEQ ID:112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:112 is located at position 53786 relative to the genome of Vaccinia Virus.

[3575] VGAM126 precursor RNA folds onto itself, forming

VGAM126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3576] An enzyme complex designated DICER COMPLEX, `dices` the VGAM126 folded precursor RNA into VGAM126 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM126 RNA is designated SEQ ID:461, and is provided hereinbelow with reference to the sequence listing part.

[3577] VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM126 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[3578] VGAM126 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM126 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM126 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3579] The complementary binding of VGAM126 RNA, herein designated VGAM RNA, to host target binding sites on VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM126 host target RNA into VGAM126 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3580] It is appreciated that VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM126 host target genes. The mRNA of each one of this plurality of VGAM126 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM126 RNA, herein designated VGAM RNA, and which when bound by VGAM126 RNA causes inhibition of translation of respective one or more VGAM126 host target proteins.

[3581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM126 gene, herein designated VGAM GENE, on one or more VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3582] It is yet further appreciated that a function of VGAM126 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM126 correlate with, and may be deduced from, the identity of the host target genes which VGAM126 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[3583] Nucleotide sequences of the VGAM126 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM126 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM126 are further described hereinbelow with reference to Table 1.

[3584] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM126 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM126 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3585] As mentioned hereinabove with reference to Fig. 1, a function of VGAM126 gene, herein designated VGAM is inhibition of expression of VGAM126 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM126 correlate with, and may be deduced from, the identity of the target genes which VGAM126 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[3586] Deafness, Autosomal Dominant 5 (DFNA5, Accession NM_004403) is a VGAM126 host target gene. DFNA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFNA5 BINDING SITE, designated SEQ ID:1109, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:461.

[3587] A function of VGAM126 is therefore inhibition of Deafness, Autosomal Dominant 5 (DFNA5, Accession NM_004403). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFNA5. Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181) is another VGAM126 host target gene. LRAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:2557, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:461.

[3588] Another function of VGAM126 is therefore inhibition of Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694) is another VGAM126 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:2449, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:461.

[3589] Another function of VGAM126 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal reces-

sive) (PKHD1, Accession NM_138694). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. HSPC055 (Accession NM_014153) is another VGAM126 host target gene. HSPC055 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPC055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC055 BINDING SITE, designated SEQ ID:1480, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:461.

[3590] Another function of VGAM126 is therefore inhibition of HSPC055 (Accession NM_014153). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC055. PRO0386 (Accession NM_018562) is another VGAM126 host target gene. PRO0386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PRO0386 BINDING SITE, designated SEQ ID:1845, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:461.

[3591] Another function of VGAM126 is therefore inhibition of PRO0386 (Accession NM_018562). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0386. LOC121441 (Accession XM_058561) is another VGAM126 host target gene. LOC121441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121441 BINDING SITE, designated SEQ ID:2992, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:461.

[3592] Another function of VGAM126 is therefore inhibition of LOC121441 (Accession XM_058561). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121441. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 127 (VGAM127) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3593] VGAM127 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM127 was detected is described hereinabove with reference to Figs. 1–8.

[3594] VGAM127 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM127 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3595] VGAM127 gene encodes a VGAM127 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM127 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM127 precursor RNA is designated SEQ ID:113, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:113 is

located at position 56050 relative to the genome of Vac-
cinia Virus.

[3596] VGAM127 precursor RNA folds onto itself, forming VGAM127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3597] An enzyme complex designated DICER COMPLEX, `dices` the VGAM127 folded precursor RNA into VGAM127 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM127 RNA is designated SEQ ID:462, and is provided hereinbelow with reference to the sequence listing part.

[3598] VGAM127 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM127 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM127 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[3599] VGAM127 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM127 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM127 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM127 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM127 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[3600] The complementary binding of VGAM127 RNA, herein designated VGAM RNA, to host target binding sites on VGAM127 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM127 host target RNA into VGAM127 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3601] It is appreciated that VGAM127 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM127 host target genes. The mRNA of each one of this plurality of VGAM127 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM127 RNA, herein designated VGAM RNA, and which when bound by VGAM127 RNA causes inhibition of translation of respective one or more VGAM127

host target proteins.

[3602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM127 gene, herein designated VGAM GENE, on one or more VGAM127 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3603] It is yet further appreciated that a function of VGAM127 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM127 correlate with, and may be deduced from, the identity of the host target genes which VGAM127 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3604] Nucleotide sequences of the VGAM127 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM127 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM127 are further described hereinbelow with reference to Table 1.

[3605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM127 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM127 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3606] As mentioned hereinabove with reference to Fig. 1, a function of VGAM127 gene, herein designated VGAM is inhibition of expression of VGAM127 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM127 correlate with, and may be deduced from, the identity of the target genes which VGAM127 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3607] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038) is a VGAM127 host target gene. ADAMTS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:1351, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3608] A function of VGAM127 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ADAMTS5. The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762) is another VGAM127 host target gene. BHLHB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHLHB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB3 BINDING SITE, designated SEQ ID:2161, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3609] Another function of VGAM127 is therefore inhibition of Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762), a gene which represses both basal and activated transcription. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB3. The function of BHLHB3 has been established by previous studies. By searching EST databases for se-

quences similar to DEC1, followed by 5-prime and 3-prime RACE with chondrocyte cDNA, Fujimoto et al. (2001) obtained cDNAs encoding human and mouse DEC2. The deduced 482-amino acid human DEC2 protein contains a bHLH domain and an Orange domain that are highly conserved with those of mouse Dec2 and rat Sharp1. DEC2 also has a C-terminal alanine/glycine-rich region not seen in DEC1. Northern blot analysis detected a 3.6-kb DEC2 transcript that was highly expressed in skeletal muscle and brain, moderately expressed in pancreas and heart, expressed at low levels in placenta and lung, and expressed at very low levels in liver and kidney. RT-PCR analysis detected ubiquitous but variable expression of DEC2. Using yeast 1-hybrid screens and reporter analysis, Garriga-Canut et al. (2001) showed that rat Sharp1 binds to the M1 muscarinic acetylcholine receptor (see OMIM Ref. No. CHRM1; 118510) and acts as a transcriptional repressor of both TATA-containing and TATA-less promoters. Repression occurs either via the bHLH domain or via a C-terminal domain that is sensitive to the histone deacetylase inhibitor trichostatin A.

[3610] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [3611] Garriga-Canut, M.; Roopra, A.; Buckley, N. J. : The basic helix-loop-helix protein, SHARP-1, represses transcription by a histone deacetylase-dependent and histone deacetylase-independent mechanism. J. Biol. Chem. 276: 14821-14828, 2001. ; and
- [3612] Fujimoto, K.; Shen, M.; Noshiro, M.; Matsubara, K.; Shingu, S.; Honda, K.; Yoshida, E.; Suardita, K.; Matsuda, Y.; Kato, Y. : Molecular cloning and characterization of DEC2, a new memb.
- [3613] Further studies establishing the function and utilities of BHLHB3 are found in John Hopkins OMIM database record ID 606200, and in cited publications numbered 210-211 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM_000647) is another VGAM127 host target gene. CCR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR2 BINDING SITE, designated SEQ ID:767, to the nucleotide se-

quence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3614] Another function of VGAM127 is therefore inhibition of Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM_000647), a gene which binds chemokines and transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR2. The function of CCR2 has been established by previous studies. Charo et al. (1994) isolated 2 cDNAs by degenerate PCR using primers for a conserved region in the second and third transmembrane domains of the MIP-1-alpha/RANTES receptor (OMIM Ref. No. 601159) and IL-8 receptors (146928, 146929). They then used PCR products to screen a human monocytic leukemia-cell library. The 2 cDNAs encoded putative chemokine receptors (termed A and B) that are identical except for their C termini and thus appear to result from alternative splicing. The 347-amino acid predicted protein from the A isoform, designated MCP1RA (and later termed CC CKR2A by Combadiere et al., 1995), is 51% identical to the MIP-1-alpha/RANTES receptor. As are the other members of this receptor family, MCP1RA is a

7-transmembrane G protein-coupled receptor. Combadiere et al. (1995) demonstrated that the predominant agonist for CC CKR2A is MCP1, while both MCP1 and MCP3 (OMIM Ref. No. 158106) are ligands for the CC CKR2B isoform (Combadiere et al., 1995). Animal model experiments lend further support to the function of CCR2. Peters et al. (2000) observed that after immunization with Th1-inducing agents, Ccr2 $-/-$ mice produced markedly less gamma-interferon (IFNG; 147570) after antigen-specific stimulation than did wildtype mice. In contrast, IL5 (OMIM Ref. No. 147850), IL10 (OMIM Ref. No. 124092), and IL13 (OMIM Ref. No. 147683) production was not impaired in Ccr2 $-/-$ mice. Flow cytometric analysis showed that fewer antigen-presenting cells migrated to the immunization site or draining lymph nodes in the Ccr2 $-/-$ mice. Peters et al. (2000) concluded that CCR2 is required for proper trafficking of antigen-presenting cells capable of inducing IFNG production by T cells.

[3615] It is appreciated that the abovementioned animal model for CCR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3616] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [3617] Combadiere, C.; Ahuja, S. K.; Van Damme, J.; Tiffany, H. L.; Gao, J.-L.; Murphy, P. M. : Monocyte chemoattractant protein-3 is a functional ligand for CC chemokine receptors 1 and 2B. J. Biol. Chem. 270: 29671-29675, 1995. ; and
- [3618] Peters, W.; Dupuis, M.; Charo, I. F. : A mechanism for the impaired IFN-gamma production in C-C chemokine receptor 2 (CCR2) knockout mice: role of CCR2 in linking the innate and adaptive.
- [3619] Further studies establishing the function and utilities of CCR2 are found in John Hopkins OMIM database record ID 601267, and in cited publications numbered 2084-2085, 2090, 2095-209 and 2138-2105 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Decorin (DCN, Accession NM_001920) is another VGAM127 host target gene. DCN BINDING SITE1 through DCN BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DCN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DCN BINDING SITE1 through DCN BINDING SITE6, designated SEQ ID:868, SEQ ID:2421, SEQ ID:2422, SEQ ID:2423, SEQ ID:2424 and SEQ ID:2425 respectively, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3620] Another function of VGAM127 is therefore inhibition of Decorin (DCN, Accession NM_001920), a gene which may mediate in epithelial/mesenchymal interactions . Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCN. The function of DCN has been established by previous studies. Decorin and biglycan (OMIM Ref. No. 301870) are related but distinct small proteoglycans found in many connective tissues. Danielson et al. (1993) found that the human decorin gene spans more than 38 kb and contains 8 exons and very large introns, 2 of which are 5.4 and more than 13.2 kb. They discovered 2 alternatively spliced leader exons, Ia and Ib, in the 5-prime untranslated region. Using Northern blotting or reverse transcriptase PCR, they detected the 2 leader exons in a variety of mRNAs isolated from human cell lines and tissues. Sequences highly homologous (OMIM Ref. No. 74-87%) to exons Ia and Ib were found in the 5-prime un-

translated region of avian and bovine decorin, respectively. This high degree of conservation among species suggested regulatory functions for these leader exons. In situ hybridization studies of developing mouse embryos suggested that decorin may play a role in epithelial/mesenchymal interactions during organ development and shaping (Scholzen et al., 1994). Dyne et al. (1996) studied 2 patients with osteogenesis imperfecta and the same gly415-to-ser mutation of the COL1A1 gene (120150.0044), but a different clinical expression. They speculated that these differences could be the result of abnormalities in other connective tissue proteins. Since decorin is a component of connective tissue, binds to type I collagen fibrils, and plays a role in matrix assembly, they studied decorin production in skin fibroblasts from these 2 patients. Cultured fibroblasts from the patient with extremely severe osteogenesis imperfecta (classified as type II/III) were found to secrete barely detectable amounts of decorin into culture medium. Northern blot analysis showed decorin mRNA levels below the limit of detection. The patient with a less severe phenotype had fibroblasts that expressed decorin normally. Dyne et al. (1996) suggested that the different clinical phenotypes could be due

to the differing genetic backgrounds of the patients, such that in the more severely affected patient the absence of decorin aggravated the clinical phenotype.

[3621] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3622] Scholzen, T.; Solursh, M.; Suzuki, S.; Reiter, R.; Morgan, J. L.; Buchberg, A. M.; Siracusa, L. D.; Iozzo, R. V. : The murine decorin: complete cDNA cloning, genomic organization, chromosomal assignment, and expression during organogenesis and tissue differentiation. J. Biol. Chem. 269: 28270–28281, 1994. ; and

[3623] Dyne, K. M.; Valli, M.; Forlino, A.; Mottes, M.; Kresse, H.; Cetta, G. : Deficient expression of the small proteoglycan decorin in a case of severe/lethal osteogenesis imperfecta. Am. J.

[3624] Further studies establishing the function and utilities of DCN are found in John Hopkins OMIM database record ID 125255, and in cited publications numbered 446–455 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fatty Acid Synthase (FASN, Accession NM_004104) is another VGAM127 host target gene. FASN BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by FASN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASN BINDING SITE, designated SEQ ID:1088, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3625] Another function of VGAM127 is therefore inhibition of Fatty Acid Synthase (FASN, Accession NM_004104), a gene which catalyzes the formation of long-chain fatty acids from acetyl-coa, malonyl-coa and nadph. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASN. The function of FASN has been established by previous studies. Fatty acid synthase (EC 2.3.1.85) catalyzes the conversion of acetyl-CoA and malonyl-CoA, in the presence of NADPH, into long-chain saturated fatty acids (Wakil, 1989). In prokaryotes and plants, FASN consists of an acyl carrier protein and 7 structurally independent monofunctional enzymes. In animals, however, all of the component enzymatic activities of FASN and acyl carrier protein are organized in one large polypeptide chain.

Loftus et al. (2000) identified a link between anabolic energy metabolism and appetite control. Both systemic and intracerebroventricular treatment of mice with fatty acid synthase inhibitors (cerulenin and C75, a synthetic compound) led to inhibition of feeding and dramatic weight loss. C75 inhibited expression of the prophagic signal neuropeptide Y (OMIM Ref. No. 162640) in the hypothalamus and acted in a leptin (OMIM Ref. No.

164160)-independent manner that appears to be mediated by malonyl-CoA. Loftus et al. (2000) suggested that FASN may represent an important link in feeding regulation and may be a potential therapeutic target for obesity.

[3626] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3627] Loftus, T. M.; Jaworsky, D. E.; Frehywot, G. L.; Townsend, C. A.; Ronnett, G. V.; Lane, M. D.; Kuhajda, F. P. : Reduced food intake and body weight in mice treated with fatty acid synthase inhibitors. *Science* 288: 2379–2381, 2000. ; and

[3628] Wakil, S. J. : Fatty acid synthase, a proficient multifunctional enzyme. *Biochemistry* 28: 4523–4530, 1989.

[3629] Further studies establishing the function and utilities of

FASN are found in John Hopkins OMIM database record ID 600212, and in cited publications numbered 2441–2445 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inhibin, Beta B (activin AB beta polypeptide) (INHBB, Accession NM_002193) is another VGAM127 host target gene. INHBB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INHBB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INHBB BINDING SITE, designated SEQ ID:905, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3630] Another function of VGAM127 is therefore inhibition of Inhibin, Beta B (activin AB beta polypeptide) (INHBB, Accession NM_002193), a gene which inhibits inhibit the secretion of follitropin by the pituitary gland. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBB. The function of INHBB has been established by previous studies. The activins, dimers of beta-A or beta-B subunits encoded by the genes *Inhba* (OMIM Ref.

No. 147290) and Inhbb, respectively, are TGF-beta (see OMIM Ref. No. 190180) superfamily members that have roles in reproduction and development (Brown et al., 2000). Activin ligands act as growth and differentiation factors in many cells and tissues. Mellor et al. (2000) examined the localization of and dimerization among activin subunits. The results demonstrated that activin beta-C (see OMIM Ref. No. 601233) can form dimers with activin beta-A and beta-B in vitro, but not with the inhibin alpha subunit (OMIM Ref. No. 147380). Using a specific antibody, activin beta-C protein was localized to human liver and prostate and colocalized with beta-A and beta-B subunits to specific cell types in benign and malignant prostate tissues. The capacity to form novel activin heterodimers (but not inhibin C) appears to reside in the human liver and prostate. The authors concluded that formation of activin AC or BC heterodimers may have significant implications in the regulation of levels and/or biologic activity of other activins in these tissues. Malignancy of pheochromocytomas is difficult to estimate on the basis of histopathologic features. In a search for new markers to differentiate malignant pheochromocytomas from benign ones, Salmenkivi et al. (2001) tested the value of

inhibin/activin subunit expression. Inhibins are heterodimeric glycoproteins consisting of an alpha subunit and either a beta-A or a beta-B subunit. Activins are composed of beta subunits only. Immunohistochemically, inhibin/activin beta-B subunit was strongly positive in the normal adrenal medulla, but the cortex was negative. A striking difference was found in inhibin/activin beta-B expression between benign and malignant pheochromocytomas. The majority of benign adrenal tumors (27 of 30) showed strong or moderate immunoreactivity, whereas all 7 malignant tumors were negative or only weakly positive for inhibin/activin beta-B subunit. Salmenkivi et al. (2001) suggested that inhibin/activin beta-B subunit is expressed in normal adrenal medullary cells. Strong staining was found in most benign adrenal pheochromocytomas, whereas malignant tumors were almost negative. They concluded that loss of inhibin/activin beta-B subunit expression in pheochromocytomas may be used as an indicator of malignant potential. Animal model experiments lend further support to the function of INHBB. Whereas mice homozygous for the *Inhba*-null allele demonstrate disruption of whisker, palate, and tooth development leading to neonatal lethality, homozygous *Inhbb*-null mice

are viable, fertile, and have eye defects. To determine if these phenotypes were due to spatiotemporal expression differences of the ligands or disruption of specific ligand–receptor interactions, Brown et al. (2000) replaced the region of *Inhba* encoding the mature protein with *Inhbb*, creating the allele designated *Inhba*(BK). Although the craniofacial phenotypes of the *Inhba*–null mutation were rescued by the *Inhba*(BK) allele, somatic, testicular, genital, and hair growth were grossly affected and influenced by the dosage and bioactivity of the allele. Thus, Brown et al. (2000) concluded that functional compensation within the TGF–beta superfamily can occur if the replacement gene is expressed appropriately. The novel phenotypes in these mice further illustrate the usefulness of insertion strategies for defining protein function. The structural organization of the testes of adult *Inhba*(BK/BK) mice was normal; however, the differentiation of the seminiferous tubules of *Inhba*(BK/–) mice was delayed. The testicular volumes of both *Inhba*(BK/BK) and *Inhba*(BK/–) mice were less than those of controls, and the dosage of the *Inhba*(BK) allele correlated positively with testicular size. *Inhba*(+/BK) males had normal onset of fertility, whereas *Inhba*(BK/BK) males had delayed onset of fertility similar to

Acvr2 (OMIM Ref. No. 102581) -/- mice. Only 1 in 6 Inhba(BK/BK) females produced litters, whereas Inhba(+ /BK) females were normally fertile. The ovaries of Inhba(BK/-) mice were smaller and contained fewer large preantral follicles than those of controls. Inhba(BK/BK) and Inhba(BK/-) mice were identified by their smaller size, slower hair growth, the rough appearance of their fur, and sunken eyes. Approximately 50% of Inhba(BK/BK) mice died by 26 weeks, whereas Inhba(BK/-) mice invariably became cachectic and died between 3 and 4 weeks. The summary of phenotypic findings of Inhba(BK/-) mice includes short whiskers, normal tooth development, no cleft palate, symmetric growth deficiency (OMIM Ref. No. severe), enlargement of external genitalia, hypogonadism (OMIM Ref. No. severe), delayed hair growth (moderate), hypoglycemia (mild), decreased life expectancy (OMIM Ref. No. severe), and anemia

[3631] It is appreciated that the abovementioned animal model for INHBB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3632] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [3633] Salmenkivi, K.; Arola, J.; Voutilainen, R.; Ilvesmaki, V.; Haglund, C.; Kahri, A. I.; Heikkila, P.; Liu, J. : Inhibin/activin beta-B-subunit expression in pheochromocytomas favors benign diagnosis. J. Clin. Endocr. Metab. 86: 2231-2235, 2001. ; and
- [3634] Brown, C. W.; Houston-Hawkins, D. E.; Woodruff, T. K.; Matzuk, M. M. : Insertion of Inhbb into the Inhba locus rescues the Inhba-null phenotype and reveals new activin functions. Nature.
- [3635] Further studies establishing the function and utilities of INHBB are found in John Hopkins OMIM database record ID 147390, and in cited publications numbered 1190, 2624-119 and 2625-2626 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM_046129) is another VGAM127 host target gene. NEDD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4 BIND-

ING SITE, designated SEQ ID:2875, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3636] Another function of VGAM127 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM_046129), a gene which ubiquitinates regulatory proteins involved in transcription. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4. The function of NEDD4 has been established by previous studies. Kumar et al. (1992) identified Nedd4 as one of a group of mouse genes that show developmentally regulated expression in mouse embryonic brain. Kumar et al. (1997) showed that Nedd4 is expressed in various other embryonic tissues and persists in most adult tissues. Using antibody raised against a fusion protein, they demonstrated that the Nedd4 protein is localized to the cellular cytoplasm. Kumar et al. (1997) reported that the human NEDD4 protein has 86% amino acid identity with the mouse protein. It has homology to ubiquitin-protein ligases and contains 4 protein-protein interaction (WW) domains and a calcium/phospholipid binding domain. Imhof and McDonnell (1996) found that both hu-

man NEDD4 and yeast RSP5 potentiate hormone-dependent activation of transcription by the human progesterone and glucocorticoid receptors. They used mutant proteins to show that neither the ubiquitin-protein ligase activity nor the WW domains are absolutely required for the potentiation of the steroid receptors.

[3637] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3638] Imhof, M. O.; McDonnell, D. P. : Yeast RSP5 and its human homolog hRPF1 potentiate hormone-dependent activation of transcription by human progesterone and glucocorticoid receptors. *Molec. Cell. Biol.* 16: 2594–2605, 1996. ; and

[3639] Kumar, S.; Harvey, K. F.; Kinoshita, M.; Copeland, N. G.; Noda, M.; Jenkins, N. A. : cDNA cloning, expression analysis, and mapping of the mouse Nedd4 gene. *Genomics* 40: 435–443, 1997.

[3640] Further studies establishing the function and utilities of NEDD4 are found in John Hopkins OMIM database record ID 602278, and in cited publications numbered 1712–64 and 336 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear

Transcription Factor Y, Alpha (NFYA, Accession NM_021705) is another VGAM127 host target gene. NFYA BINDING SITE1 and NFYA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NFYA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFYA BINDING SITE1 and NFYA BINDING SITE2, designated SEQ ID:1955 and SEQ ID:933 respectively, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3641] Another function of VGAM127 is therefore inhibition of Nuclear Transcription Factor Y, Alpha (NFYA, Accession NM_021705), a gene which stimulates the transcription of various genes by recognizing and binding to a ccaat motif in promoters. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFYA. The function of NFYA has been established by previous studies. NF-Y is a transcription factor thought to be essential for expression of the class II genes of the major histocompatibility complex (MHC; OMIM Ref. No. 142800). It recognizes a CCAAT

motif upstream of gene promoters and is probably involved in the regulation of a variety of genes, including those for albumin (OMIM Ref. No. 103600), alpha-globin (OMIM Ref. No. 141800), collagen (see OMIM Ref. No. 120150), and beta-actin (OMIM Ref. No. 102630). NF-Y is composed of 2 subunits, NFYA and NFYB (OMIM Ref. No. 189904), both of which are necessary for DNA binding. This 2-subunit DNA-binding unit has been well conserved during evolution. NFYA and NFYB show striking sequence similarity with the yeast transcription factors Hap2 and Hap3, both of which are required for specific binding to a CCAAT-like motif. By in situ hybridization and analysis of somatic cell hybrids, Li et al. (1991) assigned the NFYA gene to 6p21 (close to MHC) and the NFYB gene to human chromosome 12. After in situ hybridization, the maximum concentration of grains was in the region 12q22-q23. By Southern blot analysis of recombinant inbred lines and by in situ hybridization, the Nfya and Nfyb genes were assigned to mouse chromosome 17 and mouse chromosome 10, respectively. CCAAT, an upstream sequence element found in a multitude of higher eukaryotic promoters, serves as the recognition sequence for a variety of mammalian transcription factors. There are at least 3 chro-

matographically separable CCAAT-binding factors in HeLa cells: CP1, CP2, and CTF/NF-1 (OMIM Ref. No. 600729). These factors recognize overlapping but distinct subsets of known CCAAT-containing promoters and make distinguishable patterns of contacts with DNA in and around the CCAAT motif. Becker et al. (1991) noted that of these 3 factors, CP1 bears the greatest resemblance to the yeast Hap complex. This complex of 3 genes, Hap2, Hap3, and Hap4, is required for the expression of respiration in *Saccharomyces cerevisiae*--in particular, for expression of the principal isoform of cytochrome C (CYC1; 123980). In the yeast, 3 proteins are associated in a heteromeric complex that binds to an upstream activation sequence in the CYC1 promoter. Like Hap2/3/4, CYP in the human consists of a heteromeric association of at least 2 components, CP1A and CP1B, both of which are required for binding. Most strikingly, the subunits of CP1 and Hap2/3/4 can be interchanged in vitro. Thus, CP1 likely represents the human homolog of the yeast Hap complex, with the CP1B fraction containing the Hap2 homolog and the CP1A fraction containing a Hap3 equivalent. Becker et al. (1991) reported the isolation of a HeLa cDNA whose expression in *S. cerevisiae* corrected the respiratory defect

in a strain bearing a Hap2 deletion. The cDNA encoding the human Hap2 homolog encodes a protein of 257 amino acids which has a 62-amino acid C-terminal region that shares 73% identity with the essential core region of Hap2.

[3642] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3643] Becker, D. M.; Fikes, J. D.; Guarente, L. : A cDNA encoding a human CCAAT-binding protein cloned by functional complementation in yeast. Proc. Nat. Acad. Sci. 88: 1968-1972, 1991. ; and

[3644] Li, X.-Y.; Mattei, M. G.; Zaleska-Rutczynska, Z.; Hooft van Huijsduijnen, R.; Figueroa, F.; Nadeau, J.; Benoist, C.; Mathis, D. : One subunit of the transcription factor NF-Y maps close.

[3645] Further studies establishing the function and utilities of NFYA are found in John Hopkins OMIM database record ID 189903, and in cited publications numbered 40 and 3035 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAD17 Homolog (*S. pombe*) (RAD17, Accession NM_133338) is another VGAM127 host target gene. RAD17 BINDING SITE1 through RAD17 BINDING SITE6 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by RAD17, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD17 BINDING SITE1 through RAD17 BINDING SITE6, designated SEQ ID:2410, SEQ ID:2411, SEQ ID:2412, SEQ ID:2413, SEQ ID:2414 and SEQ ID:1358 respectively, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3646] Another function of VGAM127 is therefore inhibition of RAD17 Homolog (*S. pombe*) (RAD17, Accession NM_133338), a gene which may have a role in DNA damage-dependent and DNA replication-dependent cell cycle checkpoints. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD17. The function of RAD17 has been established by previous studies. Cell cycle checkpoints are complex signal transduction pathways that ensure the coordination of the timing and order of cell cycle events. These checkpoint pathways play critical roles in maintaining genomic stability and integrity to prevent the development of cancer and hereditary dis-

eases. In the fission yeast *Schizosaccharomyces pombe*, the rad17 gene is required for both the DNA damage-dependent and the DNA replication-dependent cell cycle checkpoints. Parker et al. (1998) identified expressed sequence tags corresponding to a human homolog of *S. pombe rad17*. By PCR, they isolated a human SK-N-MC neuroblastoma cell cDNA containing the complete open reading frame of this homolog, RAD17. The deduced 670-amino acid RAD17 protein has a calculated molecular mass of 71 kD and has 20% sequence identity to *S. pombe rad17*. Northern blot analysis detected an approximately 3.0-kb transcript in all tissues examined, with elevated levels in testis and cancer cell lines. Although human RAD17 did not complement the checkpoint phenotypes of an *S. pombe rad17* mutant, it interacted with human RAD1 (OMIM Ref. No. 603153) in a yeast 2-hybrid system, and Parker et al. (1998) suggested that it is the homolog of *S. pombe rad17*.

[3647] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3648] Parker, A. E.; Van de Weyer, I.; Laus, M. C.; Verhasselt, P.; Luyten, W. H. M. L. : Identification of a human homologue

of the *Schizosaccharomyces pombe* rad17+ checkpoint gene. J. Biol. Chem. 273: 18340–18346, 1998. Note: Erratum: J. Biol. Chem. 274: 24438–24439, 1999. ; and

[3650] Further studies establishing the function and utilities of RAD17 are found in John Hopkins OMIM database record ID 603139, and in cited publications numbered 1153, 228 and 1230–1231 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp762E1511 (Accession XM_003460) is another VGAM127 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:2531, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3651] Another function of VGAM127 is therefore inhibition of DKFZp762E1511 (Accession XM_003460). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969) is another VGAM127 host target gene. EIF5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EIF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5 BINDING SITE, designated SEQ ID:878, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3652] Another function of VGAM127 is therefore inhibition of Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5. LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM_015547) is another VGAM127 host target gene. LATS1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by LATS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LATS1 BINDING SITE, designated SEQ ID:2563, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3653] Another function of VGAM127 is therefore inhibition of LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM_015547). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LATS1. MGC27277 (Accession NM_144989) is another VGAM127 host target gene. MGC27277 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC27277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC27277 BINDING SITE, designated SEQ ID:2505, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3654] Another function of VGAM127 is therefore inhibition of

MGC27277 (Accession NM_144989). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27277. POLD3 (Accession XM_166243) is another VGAM127 host target gene. POLD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLD3 BINDING SITE, designated SEQ ID:3538, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3655] Another function of VGAM127 is therefore inhibition of POLD3 (Accession XM_166243). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLD3. TSLRP (Accession NM_012472) is another VGAM127 host target gene. TSLRP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TSLRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TSLRP BINDING SITE, designated SEQ ID:1435, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3656] Another function of VGAM127 is therefore inhibition of TSLRP (Accession NM_012472). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSLRP. LOC147463 (Accession XM_085799) is another VGAM127 host target gene. LOC147463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147463 BINDING SITE, designated SEQ ID:3108, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3657] Another function of VGAM127 is therefore inhibition of LOC147463 (Accession XM_085799). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147463. LOC161734 (Accession XM_102109) is an-

other VGAM127 host target gene. LOC161734 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161734 BINDING SITE, designated SEQ ID:3400, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3658] Another function of VGAM127 is therefore inhibition of LOC161734 (Accession XM_102109). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161734. LOC164173 (Accession XM_089424) is another VGAM127 host target gene. LOC164173 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164173 BINDING SITE, designated SEQ ID:3235, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3659] Another function of VGAM127 is therefore inhibition of LOC164173 (Accession XM_089424). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164173. LOC199675 (Accession XM_113982) is another VGAM127 host target gene. LOC199675 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199675 BINDING SITE, designated SEQ ID:3429, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3660] Another function of VGAM127 is therefore inhibition of LOC199675 (Accession XM_113982). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199675. LOC200150 (Accession XM_114131) is another VGAM127 host target gene. LOC200150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200150, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200150 BINDING SITE, designated SEQ ID:3439, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3661] Another function of VGAM127 is therefore inhibition of LOC200150 (Accession XM_114131). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200150. LOC51185 (Accession NM_016302) is another VGAM127 host target gene. LOC51185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51185 BINDING SITE, designated SEQ ID:1679, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3662] Another function of VGAM127 is therefore inhibition of LOC51185 (Accession NM_016302). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51185. LOC90459 (Accession XM_031826) is another VGAM127 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:2643, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:462.

[3663] Another function of VGAM127 is therefore inhibition of LOC90459 (Accession XM_031826). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. LOC91694 (Accession XM_040082) is another VGAM127 host target gene. LOC91694 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91694 BINDING SITE, designated SEQ ID:2769, to the nucleotide sequence of VGAM127 RNA, herein designated

VGAM RNA, also designated SEQ ID:462.

[3664] Another function of VGAM127 is therefore inhibition of LOC91694 (Accession XM_040082). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91694. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 128 (VGAM128) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3665] VGAM128 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM128 was detected is described hereinabove with reference to Figs. 1–8.

[3666] VGAM128 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3667] VGAM128 gene encodes a VGAM128 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM128 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM128 precursor RNA is designated SEQ ID:114, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:114 is located at position 55816 relative to the genome of Vaccinia Virus.

[3668] VGAM128 precursor RNA folds onto itself, forming VGAM128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3669] An enzyme complex designated DICER COMPLEX, `dices` the VGAM128 folded precursor RNA into VGAM128 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of VGAM128 RNA is designated SEQ ID:463, and is provided hereinbelow with reference to the sequence listing part.

[3670] VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM128 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3671] VGAM128 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM128 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM128 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[3672] The complementary binding of VGAM128 RNA, herein designated VGAM RNA, to host target binding sites on VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM128 host target RNA into VGAM128 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3673] It is appreciated that VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM128 host target genes. The mRNA of

each one of this plurality of VGAM128 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM128 RNA, herein designated VGAM RNA, and which when bound by VGAM128 RNA causes inhibition of translation of respective one or more VGAM128 host target proteins.

[3674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM128 gene, herein designated VGAM GENE, on one or more VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[3675] It is yet further appreciated that a function of VGAM128 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM128 correlate with, and may be deduced from, the identity of the host target genes which VGAM128 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[3676] Nucleotide sequences of the VGAM128 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM128 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM128 are further described hereinbelow with reference to Table 1.

[3677] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM128 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM128 RNA, herein desig—

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[3678] As mentioned hereinabove with reference to Fig. 1, a function of VGAM128 gene, herein designated VGAM is inhibition of expression of VGAM128 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM128 correlate with, and may be deduced from, the identity of the target genes which VGAM128 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3679] Sodium Channel, Nonvoltage-gated 1, Gamma (SCNN1G, Accession NM_001039) is a VGAM128 host target gene. SCNN1G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCNN1G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCNN1G BINDING SITE, designated SEQ ID:793, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:463.

[3680] A function of VGAM128 is therefore inhibition of Sodium Channel, Nonvoltage-gated 1, Gamma (SCNN1G, Acces-

sion NM_001039). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCNN1G. YY1 Transcription Factor (YY1, Accession NM_003403) is another VGAM128 host target gene. YY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YY1 BINDING SITE, designated SEQ ID:1016, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:463.

[3681] Another function of VGAM128 is therefore inhibition of YY1 Transcription Factor (YY1, Accession NM_003403), a gene which is involved in transcriptional regulation and may play an important role in development and differentiation. Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YY1. The function of YY1 has been established by previous studies. Functionally, YY1 is a versatile factor, being a negative regulator in some systems and a positive regulator in others. In some systems,

the function of YY1 as an activator or a repressor is specified by the presence of other proteins. By site-directed mutagenesis and overexpression of YY1 in human fibroblasts, Yan et al. (2002) showed that YY1, as well as HRY (OMIM Ref. No. 139605), functions as a transcriptional activator of acid alpha-glucosidase (GAA; 232300). In previous studies, Yan et al. (2001) had found that YY1, binding to the same element of the GAA gene in hepatoma cells, acts as a GAA transcription silencer. Oei and Shi (2001) noted that physical interaction had been reported between YY1 and poly(ADP-ribose) polymerase (PARP; 173870). PARP is a nuclear enzyme that catalyzes the synthesis of ADP-ribose polymers from NAD⁺, a function related to DNA repair and transcription. Oei and Shi (2001) found that overexpression of YY1 in HeLa cells resulted in intracellular accumulation of poly(ADP-ribose) and acceleration of DNA repair following damage with genotoxic agents, suggesting a functional as well as physical interaction between the proteins.

[3682] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3683] Oei, S. L.; Shi, Y. : Transcription factor Yin Yang 1 stimu-

lates poly(ADP-ribosyl)ation and DNA repair. Biochem.

Biophys. Res. Commun. 284: 450-454, 2001. ; and

[3684] Yan, B.; Raben, N.; Plotz, P. H. : Hes-1, a known transcriptional repressor, acts as a transcriptional activator for the human acid alpha-glucosidase gene in human fibroblast cells. Bi.

[3685] Further studies establishing the function and utilities of YY1 are found in John Hopkins OMIM database record ID 600013, and in cited publications numbered 1906-1910, 842-84 and 1911-1912 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ21940 (Accession NM_022828) is another VGAM128 host target gene. FLJ21940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21940 BINDING SITE, designated SEQ ID:2014, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:463.

[3686] Another function of VGAM128 is therefore inhibition of FLJ21940 (Accession NM_022828). Accordingly, utilities of

VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21940. PRO0159 (Accession NM_014118) is another VGAM128 host target gene. PRO0159 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0159 BINDING SITE, designated SEQ ID:1474, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:463.

[3687] Another function of VGAM128 is therefore inhibition of PRO0159 (Accession NM_014118). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0159. LOC200282 (Accession XM_114184) is another VGAM128 host target gene. LOC200282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200282 BINDING

SITE, designated SEQ ID:3448, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:463.

[3688] Another function of VGAM128 is therefore inhibition of LOC200282 (Accession XM_114184). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200282. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 129 (VGAM129) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3689] VGAM129 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM129 was detected is described hereinabove with reference to Figs. 1–8.

[3690] VGAM129 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM129 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3691] VGAM129 gene encodes a VGAM129 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM129 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM129 precursor RNA is designated SEQ ID:115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:115 is located at position 57776 relative to the genome of Vaccinia Virus.

[3692] VGAM129 precursor RNA folds onto itself, forming VGAM129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3693] An enzyme complex designated DICER COMPLEX, `dices` the VGAM129 folded precursor RNA into VGAM129 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM129 RNA is designated SEQ ID:464, and is provided hereinbelow with reference to the sequence listing part.

[3694] VGAM129 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM129 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[3695] VGAM129 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM129 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM129 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[3696] The complementary binding of VGAM129 RNA, herein designated VGAM RNA, to host target binding sites on VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM129 host target RNA into VGAM129 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3697] It is appreciated that VGAM129 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM129 host target genes. The mRNA of each one of this plurality of VGAM129 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM129 RNA, herein designated VGAM RNA, and which when bound by VGAM129 RNA causes inhibition of translation of respective one or more VGAM129 host target proteins.

[3698] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM129 gene, herein designated VGAM GENE, on one or more VGAM129 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[3699] It is yet further appreciated that a function of VGAM129 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM129 correlate with, and may be deduced from, the identity of the host target genes which VGAM129 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3700] Nucleotide sequences of the VGAM129 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM129 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM129 are further described hereinbelow with reference to Table 1.

[3701] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM129 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM129 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3702] As mentioned hereinabove with reference to Fig. 1, a function of VGAM129 gene, herein designated VGAM is inhibition of expression of VGAM129 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM129 correlate with, and may be deduced from, the identity of the target genes which VGAM129 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3703] Protocadherin 9 (PCDH9, Accession XM_096054) is a VGAM129 host target gene. PCDH9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH9 BINDING SITE, designated SEQ ID:3262, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:464.

[3704] A function of VGAM129 is therefore inhibition of Proto-

cadherin 9 (PCDH9, Accession XM_096054). Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH9. ERO1-like (*S. cerevisiae*) (ERO1L, Accession NM_014584) is another VGAM129 host target gene.

ERO1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERO1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERO1L BINDING SITE, designated SEQ ID:1508, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:464.

[3705] Another function of VGAM129 is therefore inhibition of ERO1-like (*S. cerevisiae*) (ERO1L, Accession NM_014584). Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERO1L. LOC253287 (Accession XM_173745) is another VGAM129 host target gene. LOC253287 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253287 BINDING SITE, designated SEQ ID:3740, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:464.

[3706] Another function of VGAM129 is therefore inhibition of LOC253287 (Accession XM_173745). Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253287. LOC254268 (Accession XM_170913) is another VGAM129 host target gene. LOC254268 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254268 BINDING SITE, designated SEQ ID:3674, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:464.

[3707] Another function of VGAM129 is therefore inhibition of LOC254268 (Accession XM_170913). Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 130 (VGAM130) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3708] VGAM130 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM130 was detected is described hereinabove with reference to Figs. 1–8.

[3709] VGAM130 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3710] VGAM130 gene encodes a VGAM130 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM130 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM130 precursor RNA is designated SEQ ID:116, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:116 is located at position 60133 relative to the genome of Vaccinia Virus.

[3711] VGAM130 precursor RNA folds onto itself, forming VGAM130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3712] An enzyme complex designated DICER COMPLEX, `dices` the VGAM130 folded precursor RNA into VGAM130 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM130 RNA is designated SEQ ID:465, and is provided hereinbelow with reference to the sequence listing part.

[3713] VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM130 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3714] VGAM130 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM130 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM130 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3715] The complementary binding of VGAM130 RNA, herein designated VGAM RNA, to host target binding sites on VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM130 host target RNA into VGAM130 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3716] It is appreciated that VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM130 host target genes. The mRNA of each one of this plurality of VGAM130 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM130 RNA, herein designated VGAM RNA, and which when bound by VGAM130 RNA causes in-

hibition of translation of respective one or more VGAM130 host target proteins.

[3717] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM130 gene, herein designated VGAM GENE, on one or more VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3718] It is yet further appreciated that a function of VGAM130 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM130 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM130 correlate with, and may be deduced from, the identity of the host target genes which VGAM130 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [3719] Nucleotide sequences of the VGAM130 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM130 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM130 are further described hereinbelow with reference to Table 1.
- [3720] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM130 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM130 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [3721] As mentioned hereinabove with reference to Fig. 1, a function of VGAM130 gene, herein designated VGAM is inhibition of expression of VGAM130 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM130 correlate with, and may be deduced from, the identity of the target genes which VGAM130 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3722] Adaptor-related Protein Complex 1, Beta 1 Subunit (AP1B1, Accession NM_001127) is a VGAM130 host target gene. AP1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1B1 BINDING SITE, designated SEQ ID:802, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3723] A function of VGAM130 is therefore inhibition of Adaptor-related Protein Complex 1, Beta 1 Subunit (AP1B1, Accession NM_001127), a gene which plays a role in protein sorting in the late-golgi/trans-golgi network (tgn) and/or endosomes. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1B1. The function of AP1B1 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to

VGAM84. Bardet-Biedl Syndrome 2 (BBS2, Accession

NM_031885) is another VGAM130 host target gene. BBS2

BINDING SITE is HOST TARGET binding site found in the

5' untranslated region of mRNA encoded by BBS2, corre-

sponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of

BBS2 BINDING SITE, designated SEQ ID:2214, to the nu-

cleotide sequence of VGAM130 RNA, herein designated

VGAM RNA, also designated SEQ ID:465.

[3724] Another function of VGAM130 is therefore inhibition of Bardet-Biedl Syndrome 2 (BBS2, Accession NM_031885). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BBS2. Fyn-related Kinase (FRK, Accession NM_002031) is another VGAM130 host target gene. FRK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FRK BINDING SITE, designated SEQ ID:890, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3725] Another function of VGAM130 is therefore inhibition of Fyn-related Kinase (FRK, Accession NM_002031), a gene which binds pRb (RB1) during G1 and S phase and suppresses growth. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRK. The function of FRK has been established by previous studies. Tyrosine kinases are either expressed cytoplasmically, such as SRC (CSK; 124095), or as transmembrane receptors, such as growth factor receptors. They are involved in signal transduction and the regulation of cellular proliferation and have been linked to tumorigenesis through overexpression or mutation. Anneren et al. (2000) showed that expression of Gtk, the rodent homolog of FRK, in a rat pheochromocytoma cell line used as a model for neuronal cell differentiation induced nerve growth factor (see OMIM Ref. No. 162030)-independent neurite outgrowth and Rap1 (OMIM Ref. No. 605061) activation, probably through activation of the CrkII (OMIM Ref. No. 164762)-C3G (GRF2; 600303) pathway.

- [3726] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [3729] Further studies establishing the function and utilities of FRK are found in John Hopkins OMIM database record ID 606573, and in cited publications numbered 1409–1413 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182) is another VGAM130 host target gene. HSPD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of HSPD1 BINDING SITE, designated SEQ ID:2560, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3730] Another function of VGAM130 is therefore inhibition of Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182), a gene which is implicated in mitochondrial protein import and macromolecular assembly. may facilitate the correct folding of imported proteins. may also prevent misfolding and promote the refolding and proper assembly of unfolded polypeptides generated under stress conditions in the mitochondrial matrix. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPD1. The function of HSPD1 has been established by previous studies. Hereditary spastic paraplegia (HSP) represents a clinically and genetically heterogeneous group of neurodegenerative disorders that are characterized by progressive spasticity and weakness of the lower limbs. Seventeen different loci had been mapped, and the corresponding genes for 5 of these had been cloned and identified. Two of the 5 gene products—paraplegin (SPG7; 602783) and spastin (SPG4;

182601)--feature AAA+ domains and are predicted to possess chaperone activity. Paraplegin is the human homolog of a yeast protease/chaperone that is involved in mitochondrial protein quality control. The HSP60 gene maps to the same region, namely 2q33.1, as does spastic paraplegia-13 (SPG13; 605280), as determined by Fontaine et al. (2000). Speculating that the mitochondrial chaperonin HSP60 or its co-chaperonin HSP10 (OMIM Ref. No. 600141), which maps to the same region, might be the site of mutation(s) causing SPG13, Hansen et al. (2002) sequenced HSP60 in 2 affected members of the family with SPG13. They found that both were heterozygous for a G-to-A variation at position 292 of the HSP60 cDNA, resulting in the substitution of a valine at position 72 in the mature HSP60 by isoleucine (V72I). Studies in *E. coli* indicated that the V72I mutant protein is functionally incapacitated. The authors suggested that SPG4, SPG7, and SPG13 can be referred to as chaperonopathies. Azem et al. (1994) performed chemical cross-linking and electron microscopy studies on bacterial chaperonins GroEL and GroES to determine how they interact with unfolded proteins. GroEL is an oligomer of 14 identical 57.3-kD subunits, with a structure of 2 stacked heptameric rings

arranged around a 2-fold axis of symmetry (Saibil et al., 1991). It appears as a hollow cylinder. In the presence of ATP, 2 GroES (see OMIM Ref. No. 600141) rings (each made of 7 identical 10.4-kD subunits) can successively bind a single GroEL core to make a functional symmetric heterodimer. Although the central core of GroEL is obstructed by the 2 GroES rings at each end, this heterodimer can stably bind and assist the refolding of the RuBisCo enzyme. While binding was thought to occur in the central cavity, these data indicate that unfolded proteins may bind and fold on the external envelope of some chaperonins (Azem et al., 1994). Schmidt et al. (1994) suggested that the symmetric chaperonin complex is functionally significant because complete folding of a nonnative substrate protein in the presence of GroEL and GroES occurs only in the presence of ATP, and not with ADP. Chaperonin-assisted folding occurs by a catalytic cycle in which one ATP is hydrolyzed by one ring of GroEL in a quantized manner with each turnover. Todd et al. (1994) proposed a unifying model for chaperonin-facilitated protein folding based on successive rounds of binding and release, and partitioning between committed and kinetically trapped intermediates.

[3731] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3732] Fontaine, B.; Davoine, C.-S.; Durr, A.; Paternotte, C.; Feki, I.; Weissenbach, J.; Hazan, J.; Brice, A. : A new locus for autosomal dominant pure spastic paraplegia, on chromosome 2q24-q34. *Am. J. Hum. Genet.* 66: 702-707, 2000. ; and

[3733] Hansen, J. J.; Durr, A.; Cournu-Rebeix, I.; Georgopoulos, C.; Ang, D.; Nielsen, M. N.; Davoine, C.-S.; Brice, A.; Fontaine, B.; Gregersen, N.; Bross, P. : Hereditary spastic paraplegia SPG.

[3734] Further studies establishing the function and utilities of HSPD1 are found in John Hopkins OMIM database record ID 118190, and in cited publications numbered 193-196, 2446-19 and 2447 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 20 Receptor, Alpha (IL20RA, Accession NM_014432) is another VGAM130 host target gene. IL20RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL20RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of IL20RA BINDING SITE, designated SEQ ID:1501, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3735] Another function of VGAM130 is therefore inhibition of Interleukin 20 Receptor, Alpha (IL20RA, Accession NM_014432), a gene which is the receptor for interleukin-20 . Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL20RA. The function of IL20RA has been established by previous studies. Blumberg et al. (2001) identified the receptor for interleukin-20 (IL20; 605619) as a heterodimer of 2 orphan class II cytokine receptor subunits, IL20RA, also called ZCYTOR7, and IL20RB (OMIM Ref. No. 605621), also called DIRS1. Binding assays using radiolabeled ligand demonstrated that IL20 bound to BHK transfectants expressing both IL20RA and IL20RB, but not to untransfected cells nor to transfectants expressing either receptor subunit alone. Binding of (125)I-labeled IL20 was eliminated in the presence of 100-fold excess of unlabeled IL20 but not in the presence of 100-fold excess of the unrelated cytokine, IL21 (OMIM

Ref. No. 605384). The binding data revealed 88,000 IL20 receptors per cell, with a binding affinity of approximately 1.5 nM. Both receptor subunits were expressed in skin and were dramatically upregulated in psoriatic skin. Scott (2001) mapped the IL20RA gene to 6q23 based on sequence similarity between the IL20RA sequence (GenBank AF184971) and a genomic contig (GenBank NT_025741.1).

- [3736] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [3737] Blumberg, H.; Conklin, D.; Xu, W.; Grossmann, A.; Brender, T.; Carollo, S.; Eagan, M.; Foster, D.; Haldeman, B. A.; Hammond, A.; Haugen, H.; Jelinek, L.; and 14 others : Interleukin 20: discovery, receptor identification, and role in epidermal function. Cell 104: 9–19, 2001. ; and
- [3738] Scott, A. F. : Personal Communication. Baltimore, Md., 3/13/2001.
- [3739] Further studies establishing the function and utilities of IL20RA are found in John Hopkins OMIM database record ID 605620, and in cited publications numbered 99 and 1611 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Laminin,

Gamma 3 (LAMC3, Accession NM_006059) is another VGAM130 host target gene. LAMC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAMC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC3 BINDING SITE, designated SEQ ID:1269, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3740] Another function of VGAM130 is therefore inhibition of Laminin, Gamma 3 (LAMC3, Accession NM_006059). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC3. Mesoderm Specific Transcript Homolog (mouse) (MEST, Accession XM_046001) is another VGAM130 host target gene. MEST BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEST BINDING SITE, designated SEQ ID:2872, to the nucleotide sequence of

VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3741] Another function of VGAM130 is therefore inhibition of Mesoderm Specific Transcript Homolog (mouse) (MEST, Accession XM_046001), a gene which appears to be required for the appropriate immediate response of females to their pups. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEST. The function of MEST has been established by previous studies. The Mest gene maps to an imprinted region of mouse chromosome 6 and is expressed monoallelically from the paternal allele. When the null allele is paternally transmitted, the offspring exhibits severe intrauterine growth retardation. Uniparental disomy of mouse chromosome 6 is associated with a similar phenotype, presumably as a result of lack of expression of the Mest gene (Ferguson-Smith et al., 1991). The human homolog, MEST, maps to 7q31.3, within a region of conserved synteny corresponding to mouse chromosome 6, and is monoallelically expressed from the paternal allele in a wide variety of tissues during prenatal and postnatal development. Uniparental disomy of chromosome 7 in humans is associated with pheno-

typic features of Silver–Russell syndrome (SRS; 180860), a heterogeneous disorder characterized by intrauterine and postnatal growth retardation, with or without additional dysmorphic features. Kotzot et al. (1995) predicted the presence of at least one maternally repressed gene on human chromosome 7, because they found maternal uniparental disomy for this chromosome in 4 of 35 patients with SRS. Nishita et al. (1996) suggested that MEST, the first imprinted gene to be identified on chromosome 7, is involved in the causation of this syndrome. Riesewijk et al. (1998) performed a mutation screen of the PEG1/MEST gene in 49 patients with SRS and 9 patients with primordial growth retardation (PGR). As background for this, they determined the complete genomic structure of the MEST gene, which comprises 12 exons. Apart from 1 silent mutation and 2 novel polymorphisms, nucleotide changes were not detected in any of the SRS or PGR patients. Moreover, methylation patterns of the 5–prime region of PEG1/MEST were found to be normal in 35 SRS and 9 PGR patients and different from the pattern seen in patients with maternal uniparental disomy 7. Kobayashi et al. (2001) presented findings indicating that PEG1/MEST can be excluded as a major determinant of SRS. In a screening

of 15 SRS patients, no aberrant expression patterns of 2 splice variants were detected in lymphocytes. Direct sequence analysis failed to detect any mutations in the coding region of isoform-1, which the authors called alpha, and there were no significant mutations in the 5-prime flanking upstream region containing the predicted promoter and the genomic region that is highly conserved between human and mouse. Differential methylation patterns of the CpG islands for the alpha isoform were normally maintained and resulted in the same patterns as in normal controls, suggesting that there was no loss of imprinting.

[3742] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3743] Nishita, Y.; Yoshida, I.; Sado, T.; Takagi, N. : Genomic imprinting and chromosomal localization of the human MEST gene. *Genomics* 36: 539–542, 1996. ; and

[3744] Kobayashi, S.; Uemura, H.; Kohda, T.; Nagai, T.; Chinen, Y.; Naritomi, K.; Kinoshita, E.; Ohashi, H.; Imaizumi, K.; Tsukahara, M.; Sugio, Y.; Tonoki, H.; Kishino, T.; Tanaka, T.; Yamada, M.

[3745] Further studies establishing the function and utilities of

MEST are found in John Hopkins OMIM database record ID 601029, and in cited publications numbered 949, 2241–2242, 2093, 2243–2246, 234 and 2438–2440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Antigen Identified By Monoclonal Antibody Ki–67 (MKI67, Accession NM_002417) is another VGAM130 host target gene. MKI67 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKI67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKI67 BINDING SITE, designated SEQ ID:927, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3746] Another function of VGAM130 is therefore inhibition of Antigen Identified By Monoclonal Antibody Ki–67 (MKI67, Accession NM_002417), a gene which thought to be required for maintaining cell proliferation. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKI67. The function of MKI67 has been established by previous studies. Ki–67 is a commercially available mono–

clonal antibody that reacts with a nuclear antigen expressed in proliferating cells but not in quiescent cells. Expression of this antigen occurs preferentially during late G1, S, G2, and M phases of the cell cycle, while in cells in G0 phase the antigen cannot be detected. Consequently, the antibody is used in tumor pathology to detect proliferating cells in neoplastic diseases. In cultured cells an antigen in the nucleolus of interphase cells stains with Ki-67, which, furthermore, reacts with an interchromatinous network during mitosis. From study of a panel of human-rodent somatic cell hybrids, Schonk et al. (1989) demonstrated that a gene involved in the expression of the antigen is located on chromosome 10. By in situ hybridization, Fonatsch et al. (1991) regionalized the MKI67 gene to 10q25-qter. By FISH, Traut et al. (1998) mapped the mouse Mki67 gene to chromosome 7F3-F5. By immunoscreening a cDNA expression library, followed by RT-PCR and 5-prime and 3-prime RACE, Schluter et al. (1993) isolated 2 cDNAs encoding isoforms of Ki-67. Genomic sequence analysis determined that the Ki-67 gene contains 15 exons. The Ki-67 repeat region, within which there is a 22-amino acid Ki-67 motif, is encoded by exon 13. The shorter isoform lacks exon 7. Northern blot anal-

ysis revealed multiple transcripts ranging from approximately 8.9 to 12.5 kb in proliferating but not quiescent cells. Immunoblot analysis showed expression of 320- and 359-kD proteins. Sequence analysis predicted that the short-lived 2,896- and 3,256-amino acid protein isoforms contain potential nuclear targeting signals, over 200 potential phosphorylation sites, 19 N-myristoylation sites, 3 amidation sites, and numerous PEST sites. Anti-sense oligonucleotides inhibited cellular proliferation in a dose-dependent manner, suggesting that Ki-67 protein expression may be an absolute requirement for cell proliferation.

[3747] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3748] Schluter, C.; Duchrow, M.; Wohlenberg, C.; Becker, M. H. G.; Key, G.; Flad, H.-D.; Gerdes, J. : The cell proliferation-associated antigen of antibody Ki-67: a very large, ubiquitous nuclear protein with numerous repeated elements, representing a new kind of cell cycle-maintaining proteins. *J. Cell. Biol.* 123: 513-522, 1993. ; and

[3749] Traut, W.; Scholzen, T.; Winking, H.; Kubbutat, M. H. G.; Gerdes, J. : Assignment of the murine Ki-67 gene (Mki67)

to chromosome band 7F3–F5 by in situ hybridization. Cytogenet. Cell Ge.

[3750] Further studies establishing the function and utilities of MKI67 are found in John Hopkins OMIM database record ID 176741, and in cited publications numbered 384–387 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Matrix Metalloproteinase 19 (MMP19, Accession NM_022790) is another VGAM130 host target gene. MMP19 BINDING SITE1 and MMP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE1 and MMP19 BINDING SITE2, designated SEQ ID:2011 and SEQ ID:2012 respectively, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3751] Another function of VGAM130 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_022790). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MMP19. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 9 (PSMD9, Accession NM_002813) is another VGAM130 host target gene. PSMD9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMD9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD9 BINDING SITE, designated SEQ ID:957, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3752] Another function of VGAM130 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 9 (PSMD9, Accession NM_002813), a gene which acts as a regulatory subunit of the 26 proteasome. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD9. The function of PSMD9 has been established by previous studies. The 26S proteasome is a eukaryotic ATP-dependent protease that selectively degrades intracellular target proteins that are modified by the covalent attachment of ubiquitin. It is composed of a

central catalytic 20S proteasome, which consists of a family of small proteins, and 2 large regulatory modules, named PA700, which consist of approximately 20 heterogeneous proteins. A proteasomal modulator complex, composed of p27, p42, and p50 subunits, stimulates the association of the 20S proteasome with PA700 to form the active 26S proteasome. Watanabe et al. (1998) cloned 2 distinct human brain cDNAs encoding p27, or PSMD9. Compared with the longer cDNA, the shorter cDNA has a 65-bp deletion near the 3-prime region that results in a new inframe termination codon farther downstream. The longer cDNA encodes a deduced 209-amino acid protein with a calculated molecular mass of 22,764 Da. The shorter cDNA encodes a deduced 223-amino acid protein with a calculated molecular mass of 24,652 Da. The longer PSMD9 protein exhibits 36% sequence identity with an *S. cerevisiae* protein, which the authors named NAS2 for 'non-ATPase subunit 2,' and 31.9% identity with a *C. elegans* protein. Disruption of the yeast NAS2 gene did not affect cell viability or proliferation. Watanabe et al. (1998) demonstrated that the PSMD9 protein, along with the ATPase components TBP1 (PSMC3; 186852) and p42 (PSMC6; 602708), associated with both the modulator

complex and the 26S proteasome complex. Northern blot analysis detected an approximately 1.3-kb PSMD9 transcript in all tissues examined, with highest levels in liver and kidney. E12 and E47 (see OMIM Ref. No. TCF3; 147141), members of the ubiquitous E2A protein family, function with basic helix-loop-helix (bHLH) proteins to bind and transactivate promoters via conserved sequence elements known as E boxes. By yeast 2-hybrid screening of a rat insulinoma cell cDNA library using the bHLH domain-containing C terminus of E12 as bait, Thomas et al. (1999) obtained a cDNA encoding rat Bridge-1. Sequence analysis predicted that the 222-amino acid Bridge-1 protein shares 98% amino acid similarity with human PSMD9 over the first 184 amino acids but diverges in the C terminus. Bridge-1 contains a PDZ-like domain from amino acids 138 to 178, forming 3 beta sheets and 2 alpha helices. SDS-PAGE analysis showed that Bridge-1 is expressed as a 28-kD protein, close to the deduced value of 25 kD. Using Bridge-1 cDNA as probe, Northern blot analysis detected a 1.0-kb transcript in all rat and human tissues tested, with highest expression in pancreas, testis, kidney, and liver. Immunocytochemistry assessment demonstrated predominant nuclear localization of Bridge-

1, with lower levels in cytoplasm. Immunoprecipitation analysis determined that anti-Bridge-1 coimmunoprecipitates E12 or E12 and E47 through their C-terminal bHLH domains, but only in the presence of the PDZ domain of Bridge-1. CAT assays indicated that Bridge-1 together with E12 or E47 coactivates insulin (OMIM Ref. No. 176730) promoter elements.

[3753] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3754] Thomas, M. K.; Yao, K.-M.; Tenser, M. S.; Wong, G. G.; Habener, J. F. : Bridge-1, a novel PDZ-domain coactivator of E2A-mediated regulation of insulin gene transcription. *Molec. Cell. Biol.* 19: 8492-8504, 1999. ; and

[3755] Watanabe, T. K.; Saito, A.; Suzuki, M.; Fujiwara, T.; Takahashi, E.; Slaughter, C. A.; DeMartino, G. N.; Hendil, K. B.; Chung, C. H.; Tanahashi, N.; Tanaka, K. : cDNA cloning and chara.

[3756] Further studies establishing the function and utilities of PSMD9 are found in John Hopkins OMIM database record ID 603146, and in cited publications numbered 1232-1233 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.SH3-domain GRB2-like 2 (SH3GL2, Accession NM_003026) is another VGAM130 host target gene. SH3GL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3GL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL2 BINDING SITE, designated SEQ ID:984, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3757] Another function of VGAM130 is therefore inhibition of SH3-domain GRB2-like 2 (SH3GL2, Accession NM_003026), a gene which plays a role in synaptic vesicle recycling, in particular in clathrin-mediated vesicle endocytosis. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL2. The function of SH3GL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM84.Spectrin, Alpha, Non-erythrocytic 1 (alpha-fodrin) (SPTAN1, Accession NM_003127) is another VGAM130 host target gene.

SPTAN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPTAN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTAN1 BINDING SITE, designated SEQ ID:994, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3758] Another function of VGAM130 is therefore inhibition of Spectrin, Alpha, Non-erythrocytic 1 (alpha-fodrin) (SPTAN1, Accession NM_003127). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTAN1. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM130 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:1146, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3759] Another function of VGAM130 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM97. Tripartite Motif-containing 9 (TRIM9, Accession NM_052978) is another VGAM130 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:2353, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3760] Another function of VGAM130 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM_052978), a gene which may function as a positive

regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM101. Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM_003307) is another VGAM130 host target gene. TRPM2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM2 BINDING SITE, designated SEQ ID:1011, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3761] Another function of VGAM130 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM_003307), a gene which

may be a calcium channel. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM2. The function of TRPM2 has been established by previous studies. By Southern analysis of somatic cell hybrids, Purrello et al. (1991) concluded that a single gene is responsible for the multiple functions of sulfated glycoprotein-2 and that the SGP2 gene is located on human chromosome 8. Slawin et al. (1990) also mapped SGP2 to chromosome 8 by Southern analysis of hamster-human hybrid cell lines. Likewise, Tobe et al. (1991) mapped the CLI gene to human chromosome 8 by spot blot hybridization of flow-sorted chromosomes using a cDNA probe. Dietzsch et al. (1992) regionalized the gene to 8p21-p12 by isotopic in situ hybridization. Using RFLVs (restriction fragment length variations) for interspecies linkage analysis, Birkenmeier et al. (1993) demonstrated that the homologous gene is located on mouse chromosome 14. By isolating and characterizing 3 partially overlapping cosmid clones, Fink et al. (1993) established the complete physical map of the clusterin gene which spans about 20 kb. By fluorescence in situ hybridization, they showed that CLI is located on 8p21, proximal to the lipoprotein lipase gene

(OMIM Ref. No. 238600). They cited information suggesting that the CLI gene may be a candidate gene determining susceptibility to atherosclerosis. Animal model experiments lend further support to the function of TRPM2. Following neonatal hypoxic-ischemic brain injury in mice (a model of cerebral palsy), there is evidence of apoptotic changes such as activation of neuronal caspase-3 (OMIM Ref. No. 600636), as well as an accumulation of clusterin in dying neurons. Han et al. (2001) generated mice deficient in clusterin by targeted disruption. Clusterin $-/-$ mice had 50% less brain injury following neonatal hypoxia-ischemia. The absence of clusterin had no effect on caspase-3 activation, and clusterin accumulation and caspase-3 activation did not colocalize to the same cells. Studies with cultured cortical neurons demonstrated that exogenous purified astrocyte-secreted clusterin exacerbated oxygen/glucose-deprivation-induced necrotic death. Han et al. (2001) concluded that clusterin may be a therapeutic target to modulate noncaspase-dependent neuronal death following acute brain injury.

[3762] It is appreciated that the abovementioned animal model for TRPM2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[3763] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3764] Fink, T. M.; Zimmer, M.; Tschopp, J.; Etienne, J.; Jenne, D. E.; Lichter, P. : Human clusterin (CLI) maps to 8p21 in proximity to the lipoprotein lipase (LPL) gene. Genomics 16: 526–528, 1993. ; and

[3765] Han, B. H.; DeMattos, R. B.; Dugan, L. L.; Kim–Han, J. S.; Brendza, R. P.; Fryer, J. D.; Kierson, M.; Cirrito, J.; Quick, K.; Harmony, J. A. K.; Aronow, B. J.; Holtzman, D. M. : Clusterin c.

[3766] Further studies establishing the function and utilities of TRPM2 are found in John Hopkins OMIM database record ID 185430, and in sited publications numbered 184–186, 108–118, 599–12 and 290–292 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP Synthase Mitochondrial F1 Complex Assembly Factor 1 (ATPAF1, Accession XM_027313) is another VGAM130 host target gene. ATPAF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATPAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATPAF1 BINDING SITE, designated SEQ ID:2582, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3767] Another function of VGAM130 is therefore inhibition of ATP Synthase Mitochondrial F1 Complex Assembly Factor 1 (ATPAF1, Accession XM_027313). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATPAF1. Centaurin, Gamma 2 (CENTG2, Accession NM_014914) is another VGAM130 host target gene. CENTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG2 BINDING SITE, designated SEQ ID:1587, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3768] Another function of VGAM130 is therefore inhibition of Centaurin, Gamma 2 (CENTG2, Accession NM_014914).

Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG2. Collagen, Type XII, Alpha 1 (COL12A1, Accession NM_080645) is another VGAM130 host target gene. COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL12A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2, designated SEQ ID:2381 and SEQ ID:1103 respectively, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3769] Another function of VGAM130 is therefore inhibition of Collagen, Type XII, Alpha 1 (COL12A1, Accession NM_080645). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL12A1. DKFZp566H0824 (Accession NM_017535) is another VGAM130 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:1721, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3770] Another function of VGAM130 is therefore inhibition of DKFZp566H0824 (Accession NM_017535). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. FLJ11726 (Accession NM_024971) is another VGAM130 host target gene. FLJ11726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11726 BINDING SITE, designated SEQ ID:2119, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3771] Another function of VGAM130 is therefore inhibition of FLJ11726 (Accession NM_024971). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ11726. FLJ12668 (Accession NM_024997) is another VGAM130 host target gene. FLJ12668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12668 BINDING SITE, designated SEQ ID:2124, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3772] Another function of VGAM130 is therefore inhibition of FLJ12668 (Accession NM_024997). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12668. FLJ13385 (Accession NM_024853) is another VGAM130 host target gene. FLJ13385 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13385, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13385 BINDING SITE, designated SEQ ID:2098, to the nucleotide sequence of

VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3773] Another function of VGAM130 is therefore inhibition of FLJ13385 (Accession NM_024853). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13385. FLJ14936 (Accession NM_032284) is another VGAM130 host target gene. FLJ14936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14936 BINDING SITE, designated SEQ ID:2243, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3774] Another function of VGAM130 is therefore inhibition of FLJ14936 (Accession NM_032284). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14936. FLJ14957 (Accession NM_032866) is another VGAM130 host target gene. FLJ14957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ14957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:2291, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3775] Another function of VGAM130 is therefore inhibition of FLJ14957 (Accession NM_032866). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957. HSU79275 (Accession XM_038959) is another VGAM130 host target gene. HSU79275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSU79275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU79275 BINDING SITE, designated SEQ ID:2746, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3776] Another function of VGAM130 is therefore inhibition of HSU79275 (Accession XM_038959). Accordingly, utilities

of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU79275. KALI (Accession NM_052931) is another VGAM130 host target gene. KALI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KALI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KALI BINDING SITE, designated SEQ ID:2346, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3777] Another function of VGAM130 is therefore inhibition of KALI (Accession NM_052931). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KALI. KIAA0121 (Accession XM_052386) is another VGAM130 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE,

designated SEQ ID:2957, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3778] Another function of VGAM130 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0254 (Accession NM_014758) is another VGAM130 host target gene. KIAA0254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0254 BINDING SITE, designated SEQ ID:1540, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3779] Another function of VGAM130 is therefore inhibition of KIAA0254 (Accession NM_014758). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0254. KIAA0820 (Accession XM_044463) is another VGAM130 host target gene. KIAA0820 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:2838, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3780] Another function of VGAM130 is therefore inhibition of KIAA0820 (Accession XM_044463). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. KIAA0863 (Accession XM_170863) is another VGAM130 host target gene. KIAA0863 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0863 BINDING SITE, designated SEQ ID:3669, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3781] Another function of VGAM130 is therefore inhibition of

KIAA0863 (Accession XM_170863). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0863. KIAA1023 (Accession NM_017604) is another VGAM130 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:1728, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3782] Another function of VGAM130 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1161 (Accession XM_088501) is another VGAM130 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:3213, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3783] Another function of VGAM130 is therefore inhibition of KIAA1161 (Accession XM_088501). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. KIAA1254 (Accession XM_046132) is another VGAM130 host target gene. KIAA1254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1254 BINDING SITE, designated SEQ ID:2876, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3784] Another function of VGAM130 is therefore inhibition of KIAA1254 (Accession XM_046132). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1254. KIAA1805 (Accession XM_086976) is another

VGAM130 host target gene. KIAA1805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1805 BINDING SITE, designated SEQ ID:3148, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3785] Another function of VGAM130 is therefore inhibition of KIAA1805 (Accession XM_086976). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1805. KIAA1866 (Accession XM_027658) is another VGAM130 host target gene. KIAA1866 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1866 BINDING SITE, designated SEQ ID:2587, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3786] Another function of VGAM130 is therefore inhibition of KIAA1866 (Accession XM_027658). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1866. KIAA1958 (Accession XM_088566) is another VGAM130 host target gene. KIAA1958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1958 BINDING SITE, designated SEQ ID:3218, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3787] Another function of VGAM130 is therefore inhibition of KIAA1958 (Accession XM_088566). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1958. LIM Domain Kinase 2 (LIMK2, Accession NM_016733) is another VGAM130 host target gene. LIMK2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LIMK2, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK2 BINDING SITE, designated SEQ ID:1709, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3788] Another function of VGAM130 is therefore inhibition of LIM Domain Kinase 2 (LIMK2, Accession NM_016733). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK2. MGC12921 (Accession XM_033362) is another VGAM130 host target gene. MGC12921 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC12921, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12921 BINDING SITE, designated SEQ ID:2666, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3789] Another function of VGAM130 is therefore inhibition of MGC12921 (Accession XM_033362). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC12921. MGC5149 (Accession XM_051200) is another VGAM130 host target gene. MGC5149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:2939, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3790] Another function of VGAM130 is therefore inhibition of MGC5149 (Accession XM_051200). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5149. MOST2 (Accession NM_020250) is another VGAM130 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:1909, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also

designated SEQ ID:465.

[3791] Another function of VGAM130 is therefore inhibition of MOST2 (Accession NM_020250). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. Mitochondrial Ribosomal Protein L9 (MRPL9, Accession NM_031420) is another VGAM130 host target gene. MRPL9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL9 BINDING SITE, designated SEQ ID:2195, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3792] Another function of VGAM130 is therefore inhibition of Mitochondrial Ribosomal Protein L9 (MRPL9, Accession NM_031420). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL9. Nuclear Cap Binding Protein Subunit 2, 20kDa (NCBP2, Accession NM_007362) is another VGAM130 host target gene. NCBP2 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCBP2 BINDING SITE, designated SEQ ID:1397, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3793] Another function of VGAM130 is therefore inhibition of Nuclear Cap Binding Protein Subunit 2, 20kDa (NCBP2, Accession NM_007362). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCBP2. Phosphate Cytidylyltransferase 1, Choline, Beta Isoform (PCYT1B, Accession NM_004845) is another VGAM130 host target gene. PCYT1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCYT1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCYT1B BINDING SITE, designated SEQ ID:1160, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ

ID:465.

[3794] Another function of VGAM130 is therefore inhibition of Phosphate Cytidylyltransferase 1, Choline, Beta Isoform (PCYT1B, Accession NM_004845). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCYT1B. PIP3-E (Accession XM_039749) is another VGAM130 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:2764, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3795] Another function of VGAM130 is therefore inhibition of PIP3-E (Accession XM_039749). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 15B (PPP1R15B, Accession NM_032833) is another VGAM130 host target gene. PPP1R15B BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by PPP1R15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R15B BINDING SITE, designated SEQ ID:2288, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3796] Another function of VGAM130 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 15B (PPP1R15B, Accession NM_032833). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R15B. Tuftelin Interacting Protein 11 (TFIP11, Accession NM_012143) is another VGAM130 host target gene. TFIP11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TFIP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFIP11 BINDING SITE, designated SEQ ID:1410, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ

ID:465.

[3797] Another function of VGAM130 is therefore inhibition of Tuftelin Interacting Protein 11 (TFIP11, Accession NM_012143). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFIP11. LOC132617 (Accession XM_067939) is another VGAM130 host target gene. LOC132617 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132617 BINDING SITE, designated SEQ ID:3039, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3798] Another function of VGAM130 is therefore inhibition of LOC132617 (Accession XM_067939). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132617. LOC147660 (Accession XM_085825) is another VGAM130 host target gene. LOC147660 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC147660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147660 BINDING SITE, designated SEQ ID:3111, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3799] Another function of VGAM130 is therefore inhibition of LOC147660 (Accession XM_085825). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147660. LOC149302 (Accession XM_086489) is another VGAM130 host target gene. LOC149302 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149302 BINDING SITE, designated SEQ ID:3129, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3800] Another function of VGAM130 is therefore inhibition of LOC149302 (Accession XM_086489). Accordingly, utilities

of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149302. LOC151720 (Accession XM_087279) is another VGAM130 host target gene. LOC151720 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151720 BINDING SITE, designated SEQ ID:3160, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3801] Another function of VGAM130 is therefore inhibition of LOC151720 (Accession XM_087279). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151720. LOC152215 (Accession XM_087407) is another VGAM130 host target gene. LOC152215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152215 BINDING SITE, designated SEQ ID:3167, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3802] Another function of VGAM130 is therefore inhibition of LOC152215 (Accession XM_087407). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152215. LOC152426 (Accession XM_098225) is another VGAM130 host target gene. LOC152426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152426 BINDING SITE, designated SEQ ID:3359, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3803] Another function of VGAM130 is therefore inhibition of LOC152426 (Accession XM_098225). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152426. LOC155179 (Accession XM_088169) is another VGAM130 host target gene. LOC155179 BINDING

SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:3199, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3804] Another function of VGAM130 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC157562 (Accession XM_098779) is another VGAM130 host target gene. LOC157562 BINDING SITE is HOST TARGET binding site found in the 5` un-translated region of mRNA encoded by LOC157562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157562 BINDING SITE, designated SEQ ID:3381, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3805] Another function of VGAM130 is therefore inhibition of

LOC157562 (Accession XM_098779). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157562. LOC163115 (Accession XM_092010) is another VGAM130 host target gene. LOC163115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163115 BINDING SITE, designated SEQ ID:3244, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3806] Another function of VGAM130 is therefore inhibition of LOC163115 (Accession XM_092010). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163115. LOC169026 (Accession XM_095471) is another VGAM130 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:3260, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3807] Another function of VGAM130 is therefore inhibition of LOC169026 (Accession XM_095471). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC170106 (Accession XM_093106) is another VGAM130 host target gene. LOC170106 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170106 BINDING SITE, designated SEQ ID:3255, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3808] Another function of VGAM130 is therefore inhibition of LOC170106 (Accession XM_093106). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170106. LOC170425 (Accession XM_084330) is an-

other VGAM130 host target gene. LOC170425 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170425 BINDING SITE, designated SEQ ID:3048, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3809] Another function of VGAM130 is therefore inhibition of LOC170425 (Accession XM_084330). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170425. LOC197342 (Accession XM_113869) is another VGAM130 host target gene. LOC197342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:3423, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3810] Another function of VGAM130 is therefore inhibition of LOC197342 (Accession XM_113869). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342. LOC200488 (Accession XM_117240) is another VGAM130 host target gene. LOC200488 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200488 BINDING SITE, designated SEQ ID:3477, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3811] Another function of VGAM130 is therefore inhibition of LOC200488 (Accession XM_117240). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200488. LOC219667 (Accession XM_166098) is another VGAM130 host target gene. LOC219667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219667, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219667 BINDING SITE, designated SEQ ID:3517, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3812] Another function of VGAM130 is therefore inhibition of LOC219667 (Accession XM_166098). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219667. LOC220980 (Accession XM_167629) is another VGAM130 host target gene. LOC220980 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:3592, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3813] Another function of VGAM130 is therefore inhibition of LOC220980 (Accession XM_167629). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220980. LOC253461 (Accession XM_172341) is another VGAM130 host target gene. LOC253461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253461 BINDING SITE, designated SEQ ID:3700, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3814] Another function of VGAM130 is therefore inhibition of LOC253461 (Accession XM_172341). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253461. LOC253502 (Accession XM_170561) is another VGAM130 host target gene. LOC253502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253502 BINDING SITE, designated SEQ ID:3660, to the nucleotide sequence of VGAM130 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:465.

[3815] Another function of VGAM130 is therefore inhibition of LOC253502 (Accession XM_170561). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253502. LOC254211 (Accession XM_172845) is another VGAM130 host target gene. LOC254211 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254211 BINDING SITE, designated SEQ ID:3707, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3816] Another function of VGAM130 is therefore inhibition of LOC254211 (Accession XM_172845). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254211. LOC90785 (Accession XM_034110) is another VGAM130 host target gene. LOC90785 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90785, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90785 BINDING SITE, designated SEQ ID:2677, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3817] Another function of VGAM130 is therefore inhibition of LOC90785 (Accession XM_034110). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90785. LOC91050 (Accession XM_035703) is another VGAM130 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:2701, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3818] Another function of VGAM130 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC91050. LOC91380 (Accession XM_038134) is another VGAM130 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:2733, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:465.

[3819] Another function of VGAM130 is therefore inhibition of LOC91380 (Accession XM_038134). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 131 (VGAM131) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3820] VGAM131 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM131 was detected is described hereinabove with reference to Figs. 1–8.

[3821] VGAM131 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3822] VGAM131 gene encodes a VGAM131 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM131 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM131 precursor RNA is designated SEQ ID:117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:117 is located at position 60496 relative to the genome of Vaccinia Virus.

[3823] VGAM131 precursor RNA folds onto itself, forming VGAM131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3824] An enzyme complex designated DICER COMPLEX, `dices` the VGAM131 folded precursor RNA into VGAM131 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM131 RNA is designated SEQ ID:466, and is provided hereinbelow with reference to the sequence listing part.

[3825] VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM131 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3826] VGAM131 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM131 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM131 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3827] The complementary binding of VGAM131 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM131 host target RNA into VGAM131 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3828] It is appreciated that VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM131 host target genes. The mRNA of each one of this plurality of VGAM131 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM131 RNA, herein designated VGAM RNA, and which when bound by VGAM131 RNA causes inhibition of translation of respective one or more VGAM131 host target proteins.

[3829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM131 gene, herein designated VGAM GENE, on one or more VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3830] It is yet further appreciated that a function of VGAM131 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM131 correlate with, and may be deduced from, the identity of the host target genes which VGAM131 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3831] Nucleotide sequences of the VGAM131 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM131 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM131 are further described hereinbelow with reference to Table 1.

[3832] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM131 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM131 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3833] As mentioned hereinabove with reference to Fig. 1, a function of VGAM131 gene, herein designated VGAM is inhibition of expression of VGAM131 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM131 correlate with, and may be deduced from, the identity of the target genes which VGAM131 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3834] Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is a VGAM131 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:1414, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:466.

[3835] A function of VGAM131 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 has been established by previous studies. Koesters et al. (1999) isolated a EIF2C1 cDNA from a human fetal kidney cDNA library. To obtain genomic sequence information, they isolated a P1 genomic clone containing the EIF2C1 locus. The human EIF2C1 gene encodes a protein of 857 amino acids. The 2,571-bp open reading frame is flanked by 238 bp of 5-prime sequence and an extremely large 3-prime untranslated region with multiple short repeated segments

composed of mono-, tri-, or quaternucleotides interspersed throughout. Northern blot analysis demonstrated that the human EIF2C1 gene is ubiquitously expressed at low to medium levels. Differential polyadenylation and splicing resulted in a complex transcriptional pattern.

Martinez et al. (2002) demonstrated that a single-stranded small interfering RNA (siRNA) resides in the human RNA-induced silencing complex (RISC) together with the EIF2C1 and/or EIF2C2 (OMIM Ref. No. 606229) proteins. RISC could be rapidly formed in HeLa cell cytoplasmic extract supplemented with 21-nucleotide siRNA duplexes, but also by adding single-stranded antisense RNAs, which range in size between 19 and 29 nucleotides.

[3836] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3837] Koesters, R.; Adams, V.; Betts, D.; Moos, R.; Schmid, M.; Siermann, A.; Hassam, S.; Weitz, S.; Lichter, P.; Heitz, P. U.; von Knebel Doeberitz, M.; Briner, J. : Human eukaryotic initiation factor EIF2C1 gene: cDNA sequence, genomic organization, localization to chromosomal bands 1q34-p35, and expression. Genomics 61: 210-218, 1999. ; and

[3839] Further studies establishing the function and utilities of EIF2C1 are found in John Hopkins OMIM database record ID 606228, and in cited publications numbered 1530–1531 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is another VGAM131 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:1461, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:466.

[3840] Another function of VGAM131 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM131 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 has been established by previous studies. Cadherins are calcium-dependent cell-cell adhesion molecules that mediate neural cell-cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHA9 is a member of the alpha cluster of protocadherin genes on 5q31. By screening a brain cDNA library for sequences with the potential to encode large proteins, Nagase et al. (1997) identified a cDNA encoding PCDHA9, which they termed KIAA0345. The deduced protein has 842 amino acids. RT-PCR analysis detected strongest expression of KIAA0345 in kidney and testis, followed by brain, lung, pancreas, and ovary.

[3841] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3842] Nagase, T.; Ishikawa, I.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; O'Hara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141-150, 1997. ; and

[3844] Further studies establishing the function and utilities of PCDHA9 are found in John Hopkins OMIM database record ID 606315, and in cited publications numbered 165 and 2153 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0923 (Accession NM_014021) is another VGAM131 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:1463, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:466.

[3845] Another function of VGAM131 is therefore inhibition of KIAA0923 (Accession NM_014021). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0923. UBF-fl (Accession NM_032828) is another VGAM131 host target gene. UBF-fl BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBF-fl, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBF-fl BINDING SITE, designated SEQ ID:2287, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:466.

[3846] Another function of VGAM131 is therefore inhibition of UBF-fl (Accession NM_032828). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBF-fl. LOC119548 (Accession XM_058404) is another VGAM131 host target gene. LOC119548 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC119548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119548 BINDING SITE, designated SEQ ID:2983, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also

designated SEQ ID:466.

[3847] Another function of VGAM131 is therefore inhibition of LOC119548 (Accession XM_058404). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119548. LOC120400 (Accession XM_061971) is another VGAM131 host target gene. LOC120400 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120400 BINDING SITE, designated SEQ ID:3027, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:466.

[3848] Another function of VGAM131 is therefore inhibition of LOC120400 (Accession XM_061971). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120400. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 132 (VGAM132) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3849] VGAM132 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM132 was detected is described hereinabove with reference to Figs. 1–8.

[3850] VGAM132 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM132 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3851] VGAM132 gene encodes a VGAM132 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM132 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM132 precursor RNA is designated SEQ ID:118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:118 is located at position 60420 relative to the genome of Vaccinia Virus.

[3852] VGAM132 precursor RNA folds onto itself, forming

VGAM132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3853] An enzyme complex designated DICER COMPLEX, `dices` the VGAM132 folded precursor RNA into VGAM132 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM132 RNA is designated SEQ ID:467, and is provided hereinbelow with reference to the sequence listing part.

[3854] VGAM132 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM132 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3855] VGAM132 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM132 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM132 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3856] The complementary binding of VGAM132 RNA, herein designated VGAM RNA, to host target binding sites on VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM132 host target RNA into VGAM132 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3857] It is appreciated that VGAM132 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM132 host target genes. The mRNA of each one of this plurality of VGAM132 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM132 RNA, herein designated VGAM RNA, and which when bound by VGAM132 RNA causes inhibition of translation of respective one or more VGAM132 host target proteins.

[3858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM132 gene, herein designated VGAM GENE, on one or more VGAM132 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3859] It is yet further appreciated that a function of VGAM132 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM132 correlate with, and may be deduced from, the identity of the host target genes which VGAM132 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[3860] Nucleotide sequences of the VGAM132 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM132 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM132 are further described hereinbelow with reference to Table 1.

[3861] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM132 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM132 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3862] As mentioned hereinabove with reference to Fig. 1, a function of VGAM132 gene, herein designated VGAM is inhibition of expression of VGAM132 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM132 correlate with, and may be deduced from, the identity of the target genes which VGAM132 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[3863] Asparaginyl-tRNA Synthetase (NARS, Accession NM_004539) is a VGAM132 host target gene. NARS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NARS BINDING SITE, designated SEQ ID:1125, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:467.

[3864] A function of VGAM132 is therefore inhibition of Asparaginyl-tRNA Synthetase (NARS, Accession NM_004539), a gene which is ASPARAGINYL-tRNA SYNTHETASE. Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NARS. The function of NARS has been established by previous studies. Using a DNA probe in human-rodent hybrid cells, Shows (1983) found that asparaginyl-tRNA synthetase segregated with peptidase A, a chromosome 18 marker. Cirullo et al. (1983) used the abbreviation-symbol 'asnS.' They isolated hybrids between human peripheral leukocytes and a tem-

perature-sensitive CHO cell line with a thermolabile asparaginyl-tRNA synthetase. Hybrids selected at 39 degrees C required the presence of human chromosome 18. Temperature-resistant hybrid cells contained 2 forms of ASNRS: 1 highly thermal resistant, like the human enzyme, and 1 highly thermolabile, like the CHO mutant enzyme.

[3865] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3866] Cirullo, R. E.; Arredondo-Vega, F. X.; Smith, M.; Wasmuth, J. J. : Isolation and characterization of interspecific heat-resistant hybrids between a temperature-sensitive Chinese hamster cell asparaginyl-tRNA synthetase mutant and normal human leukocytes: assignment of human asnS gene to chromosome 18. *Somat. Cell Genet.* 9: 215-233, 1983. ; and

[3867] Shows, T. B. : Personal Communication. Buffalo, N. Y., 1/11/1983.

[3868] Further studies establishing the function and utilities of NARS are found in John Hopkins OMIM database record ID 108410, and in cited publications numbered 327-328 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bifunctional Apop-

tosis Regulator (BFAR, Accession XM_027311) is another VGAM132 host target gene. BFAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BFAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BFAR BINDING SITE, designated SEQ ID:2581, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:467.

[3869] Another function of VGAM132 is therefore inhibition of Bifunctional Apoptosis Regulator (BFAR, Accession XM_027311). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BFAR. HSNOV1 (Accession NM_017515) is another VGAM132 host target gene. HSNOV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSNOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSNOV1 BINDING SITE, designated SEQ ID:1720, to the nucleotide sequence of VGAM132 RNA,

herein designated VGAM RNA, also designated SEQ ID:467.

[3870] Another function of VGAM132 is therefore inhibition of HSN0V1 (Accession NM_017515). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSN0V1. KIAA0628 (Accession NM_014789) is another VGAM132 host target gene. KIAA0628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0628 BINDING SITE, designated SEQ ID:1547, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:467.

[3871] Another function of VGAM132 is therefore inhibition of KIAA0628 (Accession NM_014789). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0628. KIAA1393 (Accession XM_050793) is another VGAM132 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:2936, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:467.

[3872] Another function of VGAM132 is therefore inhibition of KIAA1393 (Accession XM_050793). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. LOC147054 (Accession XM_097172) is another VGAM132 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:3289, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:467.

[3873] Another function of VGAM132 is therefore inhibition of LOC147054 (Accession XM_097172). Accordingly, utilities

of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 133 (VGAM133) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3874] VGAM133 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM133 was detected is described hereinabove with reference to Figs. 1–8.

[3875] VGAM133 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3876] VGAM133 gene encodes a VGAM133 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM133 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM133 precursor RNA is designated SEQ ID:119, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:119 is located at position 62117 relative to the genome of Vaccinia Virus.

[3877] VGAM133 precursor RNA folds onto itself, forming VGAM133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3878] An enzyme complex designated DICER COMPLEX, `dices` the VGAM133 folded precursor RNA into VGAM133 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM133 RNA is designated SEQ ID:468, and is

provided hereinbelow with reference to the sequence listing part.

[3879] VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM133 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3880] VGAM133 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM133 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM133 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3881] The complementary binding of VGAM133 RNA, herein designated VGAM RNA, to host target binding sites on VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM133 host target RNA into VGAM133 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3882] It is appreciated that VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM133 host target genes. The mRNA of each one of this plurality of VGAM133 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM133 RNA, herein designated VGAM RNA, and which when bound by VGAM133 RNA causes inhibition of translation of respective one or more VGAM133 host target proteins.

[3883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM133 gene, herein designated VGAM GENE, on one or more VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3884] It is yet further appreciated that a function of VGAM133 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM133 correlate with, and may be deduced from, the identity of the host target genes which VGAM133 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3885] Nucleotide sequences of the VGAM133 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM133 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM133 are further described hereinbelow with reference to Table 1.

[3886] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM133 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM133 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3887] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM133 gene, herein designated VGAM is inhibition of expression of VGAM133 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM133 correlate with, and may be deduced from, the identity of the target genes which VGAM133 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3888] TRIM (Accession NM_016388) is a VGAM133 host target gene. TRIM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM BINDING SITE, designated SEQ ID:1684, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:468.

[3889] A function of VGAM133 is therefore inhibition of TRIM (Accession NM_016388), a gene which plays a role in recruiting signaling proteins to the plasma membrane upon T-cell receptor (TCR) complex activation in T cells. Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM. The function of TRIM has been estab-

lished by previous studies. T-cell activation requires stimulation of the T-cell receptor (TCR; OMIM Ref. No. 186880)–CD3 (see OMIM Ref. No. CD3Z; 186780) complex, followed by recruitment of an array of intracellular signaling proteins (e.g., GRB2 (OMIM Ref. No. 108355) and PLCG1 (OMIM Ref. No. 172420)). Mediating the interaction between the extracellular receptors and intracellular signaling pathways are adaptor proteins such as LAT (OMIM Ref. No. 602354). Bruyns et al. (1998) purified a 29/30–kD disulfide–linked dimeric phosphoprotein, which they called TRIM (TCR–interacting molecule), that associates and comodulates with the TCR–CD3 complex in T lymphocytes. By tryptic peptide sequence analysis and touchdown PCR analysis of a T-cell cDNA library, they isolated a cDNA encoding TRIM. Sequence analysis predicted that TRIM is a 186–amino acid type III transmembrane protein containing an 8–amino acid extracellular domain, which includes a cys residue, and a 19–amino acid transmembrane region that lacks charged residues. The intracellular portion possesses 4 potential phosphorylation sites and 8 tyrosine residues, at least 3 of which may be involved in Src (OMIM Ref. No. 190090) homology 2 (SH2)–mediated interactions with other signaling proteins.

Northern blot analysis detected preferential expression of an approximately 2.0-kb TRIM transcript in thymus, with weaker expression in spleen, lymph nodes, and peripheral blood leukocytes. Western blot analysis of hematopoietic cell lines detected TRIM protein in T cell lines and, to a lesser extent, in natural killer cell lines, but not in B cell lines or in a monocytic cell line. Immunofluorescence and Western blot analyses showed that TRIM is localized in the cell membrane and is associated with CD3E (OMIM Ref. No. 186830) and CD3Z. The authors found that after T-cell activation, TRIM is phosphorylated by Src kinases on tyrosine residues, then associates with PIK3R1 (OMIM Ref. No. 171833).

[3890] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [3893] Further studies establishing the function and utilities of TRIM are found in John Hopkins OMIM database record ID 604962, and in cited publications numbered 1132 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MGC11296 (Accession NM_032352) is another VGAM133 host target gene. MGC11296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11296 BINDING SITE, designated SEQ ID:2248, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:468.
- [3894] Another function of VGAM133 is therefore inhibition of MGC11296 (Accession NM_032352). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC11296. PRO2037 (Accession NM_018616) is another VGAM133 host target gene. PRO2037 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2037 BINDING SITE, designated SEQ ID:1853, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:468.

[3895] Another function of VGAM133 is therefore inhibition of PRO2037 (Accession NM_018616). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2037. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 134 (VGAM134) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3896] VGAM134 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM134 was detected is described

hereinabove with reference to Figs. 1–8.

[3897] VGAM134 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3898] VGAM134 gene encodes a VGAM134 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM134 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM134 precursor RNA is designated SEQ ID:120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:120 is located at position 62005 relative to the genome of Vaccinia Virus.

[3899] VGAM134 precursor RNA folds onto itself, forming VGAM134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3900] An enzyme complex designated DICER COMPLEX, `dices` the VGAM134 folded precursor RNA into VGAM134 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM134 RNA is designated SEQ ID:469, and is provided hereinbelow with reference to the sequence listing part.

[3901] VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM134 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM134 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3902] VGAM134 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM134 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM134 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM134 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM134 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3903] The complementary binding of VGAM134 RNA, herein designated VGAM RNA, to host target binding sites on VGAM134 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM134 host target RNA into VGAM134 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3904] It is appreciated that VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM134 host target genes. The mRNA of each one of this plurality of VGAM134 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM134 RNA, herein designated VGAM RNA, and which when bound by VGAM134 RNA causes inhibition of translation of respective one or more VGAM134 host target proteins.

[3905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM134 gene, herein designated VGAM GENE, on one or more VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3906] It is yet further appreciated that a function of VGAM134 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM134 correlate with, and may be deduced from, the identity of the host target genes which VGAM134 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3907] Nucleotide sequences of the VGAM134 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM134 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM134 are further described hereinbelow with reference to Table 1.

[3908] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM134 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM134 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3909] As mentioned hereinabove with reference to Fig. 1, a function of VGAM134 gene, herein designated VGAM is inhibition of expression of VGAM134 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM134 correlate with, and may be deduced from, the identity of the target genes which VGAM134 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3910] Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_022716) is a VGAM134 host target gene. PMX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMX1, corresponding to a HOST TARGET binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE, designated SEQ ID:1996, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:469.

[3911] A function of VGAM134 is therefore inhibition of Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_022716), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1. The function of PMX1 has been established by previous studies. Homeo box genes are expressed in specific temporal and spatial patterns and function as transcriptional regulators of developmental processes. The murine homeo box gene Pmx (paired mesoderm homeo box), previously called K-2 and mHox, is expressed in a mesodermally restricted pattern in embryos and most abundantly in cardiac, skeletal, and smooth muscle tissues in adults (Kern et al., 1994). Grueneberg et al. (1992) cloned the homologous human gene. By means of interspecific backcross analysis, Kern et al. (1994) determined that the Pmx gene is located on mouse chromosome 1, approximately 3.3 cM distal to the

Gsh-4 homeo box locus. The gene contains at least 5 exons spanning a minimum of 60 kb of genomic DNA, making this the largest known murine homeo box gene. The homologous human gene may map to 1q inasmuch as this region is syntenic with the region of mouse chromosome 1 where Pmx is located. Norris et al. (2000) mapped the human PRRX1 gene to 1q23 by fluorescence in situ hybridization.

- [3912] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [3913] Grueneberg, D. A.; Natesan, S.; Alexandre, C.; Gilman, M. Z. : Human and Drosophila homeodomain proteins that enhance the DNA-binding activity of serum response factor. Science 257: 1089–1095, 1992. ; and
- [3914] Norris, R. A.; Scott, K. K.; Moore, C. S.; Stetten, G.; Brown, C. R.; Jabs, E. W.; Wulfsberg, E. A.; Yu, J.; Kern, M. J. : Human PRRX1 and PRRX2 genes: cloning, expression, genomic localiz.
- [3915] Further studies establishing the function and utilities of PMX1 are found in John Hopkins OMIM database record ID 167420, and in cited publications numbered 2517–2521 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference.FLJ22557

(Accession NM_024713) is another VGAM134 host target gene. FLJ22557 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22557 BINDING SITE, designated SEQ ID:2083, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:469.

[3916] Another function of VGAM134 is therefore inhibition of FLJ22557 (Accession NM_024713). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22557. KIAA0618 (Accession NM_014833) is another VGAM134 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:1563, to the nucleotide sequence of

VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:469.

[3917] Another function of VGAM134 is therefore inhibition of KIAA0618 (Accession NM_014833). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. LOC154215 (Accession XM_087875) is another VGAM134 host target gene. LOC154215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154215 BINDING SITE, designated SEQ ID:3188, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:469.

[3918] Another function of VGAM134 is therefore inhibition of LOC154215 (Accession XM_087875). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154215. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 135 (VGAM135) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3919] VGAM135 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM135 was detected is described hereinabove with reference to Figs. 1–8.

[3920] VGAM135 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3921] VGAM135 gene encodes a VGAM135 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM135 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM135 precursor RNA is designated SEQ ID:121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:121 is located at position 64481 relative to the genome of Vaccinia Virus.

[3922] VGAM135 precursor RNA folds onto itself, forming VGAM135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3923] An enzyme complex designated DICER COMPLEX, `dices` the VGAM135 folded precursor RNA into VGAM135 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM135 RNA is designated SEQ ID:470, and is provided hereinbelow with reference to the sequence listing part.

[3924] VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM135 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM135 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3925] VGAM135 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM135 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM135 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM135 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM135 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3926] The complementary binding of VGAM135 RNA, herein designated VGAM RNA, to host target binding sites on VGAM135 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM135 host target RNA into VGAM135 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3927] It is appreciated that VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM135 host target genes. The mRNA of each one of this plurality of VGAM135 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM135 RNA, herein designated VGAM RNA, and which when bound by VGAM135 RNA causes inhibition of translation of respective one or more VGAM135 host target proteins.

[3928] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM135 gene, herein designated VGAM GENE, on one or more VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3929] It is yet further appreciated that a function of VGAM135 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM135 correlate with, and may be deduced from, the identity of the host

target genes which VGAM135 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3930] Nucleotide sequences of the VGAM135 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM135 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM135 are further described hereinbelow with reference to Table 1.

[3931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM135 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM135 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3932] As mentioned hereinabove with reference to Fig. 1, a function of VGAM135 gene, herein designated VGAM is inhibition of expression of VGAM135 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM135 correlate with, and may be deduced from, the identity of the target genes which VGAM135

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3933] Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512) is a VGAM135 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:1220, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3934] A function of VGAM135 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP. TEM8 (Accession NM_018153) is another VGAM135 host target gene. TEM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

TEM8 BINDING SITE, designated SEQ ID:1790, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3935] Another function of VGAM135 is therefore inhibition of TEM8 (Accession NM_018153), a gene which is a tumor-specific endothelial marker. Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM8. The function of TEM8 has been established by previous studies. St. Croix et al. (2000) compared gene expression patterns of endothelial cells derived from blood vessels of normal and malignant colorectal tissues to identify genes involved in tumor angiogenesis. Among the genes they identified was TEM8, which encodes a 564-amino acid protein. Bradley et al. (2001) isolated a cDNA encoding ATR and determined that the first 364 amino acids of the 368-amino acid ATR protein are identical to those of TEM8. The C-terminal ends of the ATR and TEM8 proteins then diverge, presumably due to alternative splicing, such that ATR has a cytoplasmic tail of only 25 amino acids, whereas TEM8 has a cytoplasmic tail of 221 amino acids. (Bradley et al. (2001) noted in proof that another apparently full-length ATR/TEM8-related cDNA clone (GenBank

BC01207) encodes a protein with yet another C-terminal end.) The ATR protein contains a 27-amino acid signal peptide; a 293-amino acid extracellular domain with 3 putative end-length glycosylation sites; and a 23-amino acid putative transmembrane region followed by the short cytoplasmic tail. An extracellular von Willebrand factor type A (VWA) domain is located between residues 44 and 216 of the ATR protein. The cytoplasmic tail of ATR contains an acidic cluster (EESEE) similar to a motif in the cytoplasmic tail of furin (OMIM Ref. No. 136950) that specifies basolateral sorting of this protease in polarized epithelial cells. The mouse homolog of ATR/TEM8 is highly related to the human clones, showing more than 98% sequence identity in the extracellular domain. ATR and/or TEM8 is expressed in a number of different tissues, including central nervous system, heart, lung, and lymphocytes. Bradley et al. (2001) confirmed that the VWA domain of ATR binds directly to the protective antigen of anthrax, suggesting that ATR may also function as a protective antigen receptor. They suggested that the finding that the soluble VWA domain of ATR inhibits toxin action, coupled with the use of the cloned receptor as a tool for identifying inhibitors of the protective antigen-receptor

interaction, holds promise for the development of novel approaches for the treatment of anthrax.

[3936] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3937] St. Croix, B.; Rago, C.; Velculescu, V.; Traverso, G.; Romans, K. E.; Montgomery, E.; Lal, A.; Riggins, G. J.; Lengauer, C.; Vogelstein, B.; Kinzler, K. W. : Genes expressed in human tumor endothelium. Science 289: 1197–1202, 2000. ; and

[3938] Bradley, K. A.; Mogridge, J.; Mourez, M.; Collier, R. J.; Young, J. A. T. : Identification of the cellular receptor for anthrax toxin. Nature 414: 160–161, 2001.

[3939] Further studies establishing the function and utilities of TEM8 are found in John Hopkins OMIM database record ID 606410, and in cited publications numbered 1013, 159 and 1598 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thyrotropin-releasing Hormone Receptor (TRHR, Accession NM_003301) is another VGAM135 host target gene. TRHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRHR, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRHR BINDING SITE, designated SEQ ID:1009, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3940] Another function of VGAM135 is therefore inhibition of Thyrotropin-releasing Hormone Receptor (TRHR, Accession NM_003301), a gene which isolated central hypothyroidism. Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRHR. The function of TRHR has been established by previous studies. Thyrotropin-releasing hormone (TRH; 275120), a small neuropeptide, is widely distributed throughout the central and peripheral nervous system as well as in extraneural tissues. The peptide is synthesized in the hypothalamus and transported by the portal vascular system to the anterior pituitary where it acts on thyrotropic and lactotropic cells to promote secretion of TSH and prolactin, respectively. Thyrotropin-releasing hormone receptor is a G protein-coupled receptor that activates the inositol phospholipid-calcium-protein kinase C transduction pathway upon the binding of TRH. The TRHR gene is expressed in the thy-

rotrope cells of the anterior pituitary. Straub et al. (1990) isolated mouse Trhr cDNA from mouse pituitary thyrotropic tumor cells; the 3.8-kb cDNA encodes a protein of 393 amino acids. Zhao et al. (1992) found that the rat Trhr cDNA is 3.5 kb and encodes a protein of 412 amino acids. Matre et al. (1993) isolated a human TRHR cDNA from a human brain cDNA library. The predicted amino acid sequence of the human TRHR protein showed high homology with the rat and mouse proteins with the exception of the C-terminal region. The human gene was thought to contain 2 introns. By interspecific backcross analysis, Lossie et al. (1993) showed that the Trhr gene maps to mouse chromosome 15. They quoted work of Eide et al. (1993) assigning the human TRHR gene to the long arm of chromosome 8 by in situ hybridization. This is consistent with the finding by Lossie et al. (1993) that the mouse gene maps to a region that is homologous to 8q and contains the MYC (OMIM Ref. No. 190080) and TG (OMIM Ref. No. 188450) genes, which are located in the human 8q24 region. By studying human/hamster somatic cell hybrids, Yamada et al. (1993) assigned the TRHR gene to chromosome 8. Morrison et al. (1994) isolated a cDNA for thyrotropin-releasing hormone receptor from a human

pituitary cDNA library. By use of this cDNA as a biotinylated probe, they localized the TRHR gene to 8q23 by in situ hybridization.

- [3941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [3942] Matre, V.; Karlsen, H. E.; Wright, M. S.; Lundell, I.; Fjeldheim, A. K.; Gabrielsen, O. S.; Larhammar, D.; Gautvik, K. M. : Molecular cloning of a functional human thyrotropin-releasing hormone receptor. *Biochem. Biophys. Res. Commun.* 195: 179–185, 1993. ; and
- [3943] Morrison, N.; Duthie, S. M.; Boyd, E.; Eidne, K. A.; Connor, J. M. : Assignment of the gene encoding the human thyrotropin-releasing hormone receptor to 8q23 by fluorescence in situ hybr.
- [3944] Further studies establishing the function and utilities of TRHR are found in John Hopkins OMIM database record ID 188545, and in cited publications numbered 236 and 2449–2425 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176) is another VGAM135 host target gene. LGI2 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LGI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI2 BINDING SITE, designated SEQ ID:1792, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3945] Another function of VGAM135 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI2. MGC4638 (Accession NM_031479) is another VGAM135 host target gene. MGC4638 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4638 BINDING SITE, designated SEQ ID:2212, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3946] Another function of VGAM135 is therefore inhibition of

MGC4638 (Accession NM_031479). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4638. LOC139065 (Accession XM_066456) is another VGAM135 host target gene. LOC139065 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139065 BINDING SITE, designated SEQ ID:3035, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3947] Another function of VGAM135 is therefore inhibition of LOC139065 (Accession XM_066456). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139065. LOC154282 (Accession XM_098505) is another VGAM135 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:3372, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3948] Another function of VGAM135 is therefore inhibition of LOC154282 (Accession XM_098505). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282. LOC91516 (Accession XM_038924) is another VGAM135 host target gene. LOC91516 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91516 BINDING SITE, designated SEQ ID:2745, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:470.

[3949] Another function of VGAM135 is therefore inhibition of LOC91516 (Accession XM_038924). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91516. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 136 (VGAM136) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3950] VGAM136 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM136 was detected is described hereinabove with reference to Figs. 1–8.

[3951] VGAM136 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM136 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3952] VGAM136 gene encodes a VGAM136 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM136 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM136 precursor RNA is designated SEQ ID:122, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:122 is

located at position 65175 relative to the genome of Vac-
cinia Virus.

[3953] VGAM136 precursor RNA folds onto itself, forming VGAM136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3954] An enzyme complex designated DICER COMPLEX, `dices` the VGAM136 folded precursor RNA into VGAM136 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM136 RNA is designated SEQ ID:471, and is provided hereinbelow with reference to the sequence listing part.

[3955] VGAM136 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM136 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM136 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[3956] VGAM136 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM136 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM136 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM136 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM136 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[3957] The complementary binding of VGAM136 RNA, herein designated VGAM RNA, to host target binding sites on VGAM136 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM136 host target RNA into VGAM136 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3958] It is appreciated that VGAM136 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM136 host target genes. The mRNA of each one of this plurality of VGAM136 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM136 RNA, herein designated VGAM RNA, and which when bound by VGAM136 RNA causes inhibition of translation of respective one or more VGAM136

host target proteins.

[3959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM136 gene, herein designated VGAM GENE, on one or more VGAM136 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3960] It is yet further appreciated that a function of VGAM136 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM136 correlate with, and may be deduced from, the identity of the host target genes which VGAM136 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3961] Nucleotide sequences of the VGAM136 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM136 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM136 are further described hereinbelow with reference to Table 1.

[3962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM136 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM136 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3963] As mentioned hereinabove with reference to Fig. 1, a function of VGAM136 gene, herein designated VGAM is inhibition of expression of VGAM136 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM136 correlate with, and may be deduced from, the identity of the target genes which VGAM136 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3964] Chromosome 20 Open Reading Frame 28 (C20orf28, Accession NM_015417) is a VGAM136 host target gene. C20orf28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf28 BINDING SITE, designated SEQ ID:1629, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:471.

[3965] A function of VGAM136 is therefore inhibition of Chromosome 20 Open Reading Frame 28 (C20orf28, Accession NM_015417). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf28. MGC5139 (Accession XM_058587) is another VGAM136 host target gene. MGC5139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by MGC5139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5139 BINDING SITE, designated SEQ ID:2994, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:471.

[3966] Another function of VGAM136 is therefore inhibition of MGC5139 (Accession XM_058587). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5139. PRO0899 (Accession NM_018565) is another VGAM136 host target gene. PRO0899 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0899 BINDING SITE, designated SEQ ID:1847, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:471.

[3967] Another function of VGAM136 is therefore inhibition of PRO0899 (Accession NM_018565). Accordingly, utilities of

VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0899. PRO1386 (Accession NM_031269) is another VGAM136 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1386 BINDING SITE, designated SEQ ID:2187, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:471.

[3968] Another function of VGAM136 is therefore inhibition of PRO1386 (Accession NM_031269). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1386. Protein Tyrosine Phosphatase, Receptor Type, T (PTPRT, Accession NM_133170) is another VGAM136 host target gene. PTPRT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PTPRT BINDING SITE, designated SEQ ID:2399, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:471.

[3969] Another function of VGAM136 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, T (PTPRT, Accession NM_133170). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRT. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_020550) is another VGAM136 host target gene. TCL6 BINDING SITE1 and TCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:1919 and SEQ ID:1433 respectively, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:471.

[3970] Another function of VGAM136 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_020550). Accordingly, utilities of VGAM136 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC255759 (Accession XM_173708) is another VGAM136 host target gene. LOC255759 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255759 BINDING SITE, designated SEQ ID:3739, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:471.

[3971] Another function of VGAM136 is therefore inhibition of LOC255759 (Accession XM_173708). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255759. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 137 (VGAM137) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3972] VGAM137 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM137 was detected is described hereinabove with reference to Figs. 1–8.

[3973] VGAM137 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM137 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3974] VGAM137 gene encodes a VGAM137 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM137 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM137 precursor RNA is designated SEQ ID:123, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:123 is located at position 64691 relative to the genome of Vaccinia Virus.

[3975] VGAM137 precursor RNA folds onto itself, forming VGAM137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3976] An enzyme complex designated DICER COMPLEX, `dices` the VGAM137 folded precursor RNA into VGAM137 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM137 RNA is designated SEQ ID:472, and is provided hereinbelow with reference to the sequence listing part.

[3977] VGAM137 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM137 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM137 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[3978] VGAM137 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM137 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM137 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM137 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM137 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3979] The complementary binding of VGAM137 RNA, herein designated VGAM RNA, to host target binding sites on VGAM137 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM137 host target RNA into VGAM137 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3980] It is appreciated that VGAM137 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM137 host target genes. The mRNA of each one of this plurality of VGAM137 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM137 RNA, herein designated VGAM RNA, and which when bound by VGAM137 RNA causes inhibition of translation of respective one or more VGAM137 host target proteins.

[3981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM137 gene, herein designated VGAM GENE, on one or more VGAM137 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3982] It is yet further appreciated that a function of VGAM137 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM137 correlate with, and may be deduced from, the identity of the host target genes which VGAM137 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3983] Nucleotide sequences of the VGAM137 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM137 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM137 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM137 are further
described hereinbelow with reference to Table 1.

[3984] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM137 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM137 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[3985] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM137 gene, herein designated VGAM is
inhibition of expression of VGAM137 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM137 correlate with, and may be deduced
from, the identity of the target genes which VGAM137
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[3986] Apical Protein-like (*Xenopus laevis*) (APXL, Accession
NM_001649) is a VGAM137 host target gene. APXL BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:842, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[3987] A function of VGAM137 is therefore inhibition of Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL has been established by previous studies. APXL is a human homolog of the *Xenopus laevis* APX gene which is implicated in amiloride-sensitive sodium channel activity (Schiaffino et al., 1995). The gene contains 10 exons and spans approximately 160 kb of Xp22.3 in the ocular albinism type 1 (OA1; 300500) critical region. The full-length mRNA is approximately 7.5 kb, and Schiaffino et al. (1995) isolated several clones from a retinal cDNA library that corresponded to this mRNA. The au-

thors found that, along with retina, the gene is expressed in melanoma cells, brain, placenta, lung, kidney, and pancreas. The protein is 1,616 amino acids in length. APXL was deleted in 2 patients with contiguous gene syndromes including OA1 and in 1 patient with isolated OA1. Comparative mapping of the X chromosome in eutherian mammals has revealed distinct regions of conservation as well as evolutionary rearrangements between human and mouse. Dinulos et al. (1996) mapped the murine homologs of OA1 and APXL. They found that the 2 genes map to bands F2–F3 in both *M. spretus* and the laboratory strains C57BL/6J, defining a new rearrangement between human and mouse X chromosomes.

[3988] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3989] Dinulos, M. B.; Bassi, M. T.; Rugarli, E. I.; Chapman, V.; Ballabio, A.; Disteche, C. M. : A new region of conservation is defined between human and mouse X chromosomes. *Genomics* 35: 244–247, 1996. ; and

[3990] Schiaffino, M. V.; Bassi, M. T.; Rugarli, E. I.; Renieri, A.; Galli, L.; Ballabio, A. : Cloning of a human homologue of the *Xenopus laevis* APX gene from the ocular albinism

type 1 criti.

[3991] Further studies establishing the function and utilities of APXL are found in John Hopkins OMIM database record ID 300103, and in cited publications numbered 1990–1991 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082) is another VGAM137 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:702, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[3992] Another function of VGAM137 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483) is another VGAM137 host target gene. HMGA2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:1032, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[3993] Another function of VGAM137 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 has been established by previous studies. Ashar et al. (1995) considered the HMGIC gene a good candidate for involvement in lipoma for several reasons, including the facts that it encodes a transcriptional regulating factor, that the pygmy mouse had disproportionately less fat than normal litter mates, and that the mouse gene maps to a region of chromosome 10 with homology of synteny to human

12q14–q15. Therefore, they cloned the human gene and investigated its possible role in lipomas. In FISH studies, Ashar et al. (1995) found apparent deletion of the 3–prime end of the HMGIC gene in translocations associated with lipoma. Chimeric transcripts were isolated from 2 lipomas in which HMGIC DNA–binding domains (AT hook motifs) were fused to either a LIM or an acidic trans–activator domain. The identification of a gene rearranged in a benign neoplastic process suggests a role for HMGIC in adipogenesis and mesenchymal differentiation. Animal model experiments lend further support to the function of HMGA2. To evaluate the role of the HMGIC component in the development of lipoma, Arlotta et al. (2000) expressed the 3 DNA–binding domains of HMGIC in transgenic mice. Despite the ubiquitous expression of the truncated HMGIC protein, the transgenic mice developed a selective abundance of fat tissue early in life, showed marked adipose tissue inflammation, and had an abnormally high incidence of lipomas. These findings demonstrated that the DNA–binding domain of HMGIC, in the absence of a C–terminal fusion partner, are sufficient to perturb adipogenesis and predispose to lipomas.

[3994] It is appreciated that the abovementioned animal model

for HMGA2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3995] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3996] Ashar, H. R.; Schoenberg Fejzo, M.; Tkachenko, A.; Zhou, X.; Fletcher, J. A.; Weremowicz, S.; Morton, C. C.; Chada, K. : Disruption of the architectural factor HMGI-C: DNA-binding AT hook motifs fused in lipomas to distinct transcriptional regulatory domains. Cell 82: 57-65, 1995. ; and

[3997] Arlotta, P.; Tai, A. K.-F.; Manfioletti, G.; Clifford, C.; Jay, G.; Ono, S. J. : Transgenic mice expressing a truncated form of the high mobility group I-C protein develop adiposity and.

[3998] Further studies establishing the function and utilities of HMGA2 are found in John Hopkins OMIM database record ID 600698, and in cited publications numbered 2306-2318, 2345, 2370-2371, 79 and 2372 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 36 (K0X 18) (ZNF36, Accession XM_168302) is another VGAM137 host

target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:3626, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[3999] Another function of VGAM137 is therefore inhibition of Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 has been established by previous studies. By screening a human insulinoma cDNA library with a degenerate oligonucleotide corresponding to the H/C linker sequence, Tommerup et al. (1993) isolated cDNAs potentially encoding zinc finger proteins. Tommerup and Vissing (1995) performed sequence analysis on a number of these cDNAs and identified several novel zinc finger protein genes, including ZNF36, which they called ZNF139.

The ZNF139 cDNA predicts a protein belonging to the Kruppel family of zinc finger proteins. By isotopic in situ hybridization, Rousseau–Merck et al. (1995) mapped the ZNF36 gene, which they called KOX18, to 7q21–q22. From pulsed field gel electrophoresis studies, they showed that KOX18 is within less than 250 kb of KOX25 (ZNF38; 601261). Rousseau–Merck et al. (1995) tabulated 18 different KOX genes that had been located in pairs within 9 DNA fragments of 200 to 580 kb on 7 different chromosomes. By FISH, Tommerup and Vissing (1995) mapped the ZNF36 gene to 7q21.3–q22.1.

[4000] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4001] Tommerup, N.; Vissing, H. : Isolation and fine mapping of 16 novel human zinc finger–encoding cDNAs identify putative candidate genes for developmental and malignant disorders. *Genomics* 27: 259–264, 1995. ; and

[4002] Rousseau–Merck, M.–F.; Duro, D.; Berger, R.; Thiesen, H. J. : Chromosomal localization of two KOX zinc finger genes on chromosome bands 7q21–q22. *Ann. Genet.* 38: 81–84, 1995.

[4003] Further studies establishing the function and utilities of

ZNF36 are found in John Hopkins OMIM database record ID 601260, and in cited publications numbered 208 and 2082 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ23191 (Accession NM_024574) is another VGAM137 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:2065, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[4004] Another function of VGAM137 is therefore inhibition of FLJ23191 (Accession NM_024574). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. KIAA0841 (Accession XM_049237) is another VGAM137 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:2918, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[4005] Another function of VGAM137 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA1243 (Accession XM_057057) is another VGAM137 host target gene. KIAA1243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1243 BINDING SITE, designated SEQ ID:2977, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[4006] Another function of VGAM137 is therefore inhibition of KIAA1243 (Accession XM_057057). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1243. Ring Finger Protein 20 (RNF20, Accession NM_019592) is another VGAM137 host target gene. RNF20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF20 BINDING SITE, designated SEQ ID:1882, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[4007] Another function of VGAM137 is therefore inhibition of Ring Finger Protein 20 (RNF20, Accession NM_019592). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF20. LOC118851 (Accession XM_061180) is another VGAM137 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:3025, to the nucleotide sequence of

VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[4008] Another function of VGAM137 is therefore inhibition of LOC118851 (Accession XM_061180). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC150005 (Accession XM_097795) is another VGAM137 host target gene. LOC150005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150005 BINDING SITE, designated SEQ ID:3322, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[4009] Another function of VGAM137 is therefore inhibition of LOC150005 (Accession XM_097795). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150005. LOC221036 (Accession XM_167403) is another VGAM137 host target gene. LOC221036 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC221036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221036 BINDING SITE, designated SEQ ID:3585, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:472.

[4010] Another function of VGAM137 is therefore inhibition of LOC221036 (Accession XM_167403). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221036. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 138 (VGAM138) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4011] VGAM138 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM138 was detected is described hereinabove with reference to Figs. 1-8.

[4012] VGAM138 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4013] VGAM138 gene encodes a VGAM138 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM138 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM138 precursor RNA is designated SEQ ID:124, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:124 is located at position 63387 relative to the genome of Vaccinia Virus.

[4014] VGAM138 precursor RNA folds onto itself, forming VGAM138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4015] An enzyme complex designated DICER COMPLEX, `dices` the VGAM138 folded precursor RNA into VGAM138 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM138 RNA is designated SEQ ID:473, and is provided hereinbelow with reference to the sequence listing part.

[4016] VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM138 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4017] VGAM138 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM138 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM138 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4018] The complementary binding of VGAM138 RNA, herein designated VGAM RNA, to host target binding sites on VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM138 host tar-

get RNA into VGAM138 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4019] It is appreciated that VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM138 host target genes. The mRNA of each one of this plurality of VGAM138 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM138 RNA, herein designated VGAM RNA, and which when bound by VGAM138 RNA causes inhibition of translation of respective one or more VGAM138 host target proteins.

[4020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM138 gene, herein designated VGAM GENE, on one or more VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4021] It is yet further appreciated that a function of VGAM138 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM138 correlate with, and may be deduced from, the identity of the host target genes which VGAM138 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4022] Nucleotide sequences of the VGAM138 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM138 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM138 are further

described hereinbelow with reference to Table 1.

[4023] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM138 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM138 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4024] As mentioned hereinabove with reference to Fig. 1, a function of VGAM138 gene, herein designated VGAM is inhibition of expression of VGAM138 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM138 correlate with, and may be deduced from, the identity of the target genes which VGAM138 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4025] Component of Oligomeric Golgi Complex 7 (COG7, Accession XM_041725) is a VGAM138 host target gene. COG7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COG7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

COG7 BINDING SITE, designated SEQ ID:2795, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4026] A function of VGAM138 is therefore inhibition of Component of Oligomeric Golgi Complex 7 (COG7, Accession XM_041725). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COG7. Dual Specificity Phosphatase 5 (DUSP5, Accession NM_004419) is another VGAM138 host target gene. DUSP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP5 BINDING SITE, designated SEQ ID:1111, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4027] Another function of VGAM138 is therefore inhibition of Dual Specificity Phosphatase 5 (DUSP5, Accession NM_004419), a gene which displays phosphatase activity toward several substrates. Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with DUSP5. The function of DUSP5 has been established by previous studies. The VH1 phosphatase encoded by vaccinia virus is a dual-specificity protein-tyrosine phosphatase (OMIM Ref. No. PTPase) which hydrolyzes substrates phosphorylated on both tyrosine and serine/threonine residues. VH1-like PTPases have been identified in humans and other organisms. See DUSP1 (OMIM Ref. No. 600714). To identify additional human dual-specificity PTPases, Martell et al. (1994) screened a genomic library with a partial DUSP1 cDNA. They isolated several novel PTPase genes, including 1 which they designated HVH3 for human VH1-like PTPase-3. Kwak and Dixon (1995) cloned human placental HVH3 cDNAs and reported that the predicted protein has 384 amino acids. Using immunofluorescence, they determined that epitope-tagged HVH3 is localized primarily in the nucleus of mammalian cells. Ishibashi et al. (1994) isolated HVH3 cDNAs from a human mammary epithelial cell cDNA library and found that the predicted protein has 397 amino acids. In vitro, recombinant protein containing the catalytic domain of HVH3 displayed phosphatase activity toward several substrates. The highest relative activity was toward ERK1 (OMIM Ref. No. 601795),

suggesting that it may be a target for HVH3 activity in vivo. Northern blot analysis revealed that HVH3 is expressed as a 2.5-kb mRNA in a variety of tissues, with the highest levels in pancreas and brain. HVH3 expression was induced by serum stimulation of fibroblasts and by heat shock, with similar kinetics to those observed with DUSP1. As has been proposed for other dual-specificity PTPases like DUSP1 and DUSP2 (OMIM Ref. No. 603068), Ishibashi et al. (1994) suggested that the induction of HVH3 may lead to the deactivation of mitogen- or stress-activated protein kinases, thereby restoring these signaling pathways to their mitogen- or stress-sensitive state. By fluorescence in situ hybridization, Martell et al. (1994) mapped the HVH3 gene to 10q25

[4028] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4029] Ishibashi, T.; Bottaro, D. P.; Michieli, P.; Kelley, C. A.; Aaronson, S. A. : A novel dual specificity phosphatase induced by serum stimulation and heat shock. J. Biol. Chem. 269: 29897-29902, 1994. ; and

[4030] Martell, K. J.; Kwak, S.; Hakes, D. J.; Dixon, J. E.; Trent, J. M. : Chromosomal localization of four human VH1-like

protein-tyrosine phosphatases. Genomics 22: 462-464, 1994.

[4031] Further studies establishing the function and utilities of DUSP5 are found in John Hopkins OMIM database record ID 603069, and in cited publications numbered 2000-200 and 2280 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 6 Open Reading Frame 29 (C6orf29, Accession NM_032794) is another VGAM138 host target gene. C6orf29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf29 BINDING SITE, designated SEQ ID:2278, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4032] Another function of VGAM138 is therefore inhibition of Chromosome 6 Open Reading Frame 29 (C6orf29, Accession NM_032794). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf29. CGR19

(Accession NM_006568) is another VGAM138 host target gene. CGR19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGR19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGR19 BINDING SITE, designated SEQ ID:1311, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4033] Another function of VGAM138 is therefore inhibition of CGR19 (Accession NM_006568). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGR19. Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962) is another VGAM138 host target gene. DSCR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:1865, to the nucleotide sequence of VGAM138 RNA,

herein designated VGAM RNA, also designated SEQ ID:473.

[4034] Another function of VGAM138 is therefore inhibition of Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR6. ETL (Accession NM_022159) is another VGAM138 host target gene. ETL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ETL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETL BINDING SITE, designated SEQ ID:1982, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4035] Another function of VGAM138 is therefore inhibition of ETL (Accession NM_022159). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETL. FLJ21269 (Accession NM_025107) is another VGAM138 host target gene. FLJ21269 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ21269, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21269 BINDING SITE, designated SEQ ID:2138, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4036] Another function of VGAM138 is therefore inhibition of FLJ21269 (Accession NM_025107). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21269. HNT (Accession NM_016522) is another VGAM138 host target gene. HNT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNT BINDING SITE, designated SEQ ID:1692, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4037] Another function of VGAM138 is therefore inhibition of HNT (Accession NM_016522). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HNT. Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186) is another VGAM138 host target gene. KCNB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNB2 BINDING SITE, designated SEQ ID:3690, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4038] Another function of VGAM138 is therefore inhibition of Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNB2. KIAA0794 (Accession XM_087353) is another VGAM138 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:3163, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4039] Another function of VGAM138 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. LOC123342 (Accession XM_063602) is another VGAM138 host target gene. LOC123342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123342 BINDING SITE, designated SEQ ID:3031, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4040] Another function of VGAM138 is therefore inhibition of LOC123342 (Accession XM_063602). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123342. LOC144920 (Accession XM_096688) is an–

other VGAM138 host target gene. LOC144920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144920 BINDING SITE, designated SEQ ID:3270, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4041] Another function of VGAM138 is therefore inhibition of LOC144920 (Accession XM_096688). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144920. LOC153688 (Accession XM_098416) is another VGAM138 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:3370, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4042] Another function of VGAM138 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC51336 (Accession NM_016646) is another VGAM138 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:1707, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:473.

[4043] Another function of VGAM138 is therefore inhibition of LOC51336 (Accession NM_016646). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 139 (VGAM139) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[4044] VGAM139 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM139 was detected is described hereinabove with reference to Figs. 1–8.

[4045] VGAM139 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM139 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4046] VGAM139 gene encodes a VGAM139 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM139 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM139 precursor RNA is designated SEQ ID:125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:125 is located at position 63571 relative to the genome of Vaccinia Virus.

[4047] VGAM139 precursor RNA folds onto itself, forming VGAM139 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[4048] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM139 folded precursor RNA into VGAM139 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 89%) nucleotide se-
quence of VGAM139 RNA is designated SEQ ID:474, and is
provided hereinbelow with reference to the sequence list-
ing part.

[4049] VGAM139 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM139 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM139 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4050] VGAM139 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM139 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM139 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM139 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM139 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4051] The complementary binding of VGAM139 RNA, herein designated VGAM RNA, to host target binding sites on VGAM139 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM139 host target RNA into VGAM139 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4052] It is appreciated that VGAM139 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM139 host target genes. The mRNA of each one of this plurality of VGAM139 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM139 RNA, herein designated VGAM RNA, and which when bound by VGAM139 RNA causes inhibition of translation of respective one or more VGAM139 host target proteins.

[4053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM139 gene, herein designated VGAM GENE, on one or more VGAM139 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4054] It is yet further appreciated that a function of VGAM139 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM139 correlate with, and may be deduced from, the identity of the host target genes which VGAM139 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [4055] Nucleotide sequences of the VGAM139 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM139 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM139 are further described hereinbelow with reference to Table 1.
- [4056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM139 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM139 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [4057] As mentioned hereinabove with reference to Fig. 1, a function of VGAM139 gene, herein designated VGAM is inhibition of expression of VGAM139 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM139 correlate with, and may be deduced from, the identity of the target genes which VGAM139 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4058] Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281) is a VGAM139 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:3451, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:474.

[4059] A function of VGAM139 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A. FLJ13315 (Accession NM_025005) is another VGAM139 host target gene. FLJ13315 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13315 BINDING SITE,

designated SEQ ID:2127, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:474.

[4060] Another function of VGAM139 is therefore inhibition of FLJ13315 (Accession NM_025005). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13315. KIAA0940 (Accession NM_014912) is another VGAM139 host target gene. KIAA0940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE, designated SEQ ID:1584, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:474.

[4061] Another function of VGAM139 is therefore inhibition of KIAA0940 (Accession NM_014912). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940. SARM (Accession NM_015077) is another VGAM139 host target gene. SARM BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:1608, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:474.

[4062] Another function of VGAM139 is therefore inhibition of SARM (Accession NM_015077). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. LOC144231 (Accession XM_096561) is another VGAM139 host target gene. LOC144231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144231 BINDING SITE, designated SEQ ID:3266, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:474.

[4063] Another function of VGAM139 is therefore inhibition of

LOC144231 (Accession XM_096561). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144231. LOC148734 (Accession XM_086294) is another VGAM139 host target gene. LOC148734 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148734 BINDING SITE, designated SEQ ID:3124, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:474.

[4064] Another function of VGAM139 is therefore inhibition of LOC148734 (Accession XM_086294). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148734. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 140 (VGAM140) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[4065] VGAM140 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM140 was detected is described hereinabove with reference to Figs. 1–8.

[4066] VGAM140 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM140 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4067] VGAM140 gene encodes a VGAM140 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM140 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM140 precursor RNA is designated SEQ ID:126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:126 is located at position 62804 relative to the genome of Vaccinia Virus.

[4068] VGAM140 precursor RNA folds onto itself, forming VGAM140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[4069] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM140 folded precursor RNA into VGAM140 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 73%) nucleotide se-
quence of VGAM140 RNA is designated SEQ ID:475, and is
provided hereinbelow with reference to the sequence list-
ing part.

[4070] VGAM140 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM140 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM140 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[4071] VGAM140 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM140 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM140 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM140 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM140 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[4072] The complementary binding of VGAM140 RNA, herein designated VGAM RNA, to host target binding sites on VGAM140 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM140 host target RNA into VGAM140 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4073] It is appreciated that VGAM140 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM140 host target genes. The mRNA of each one of this plurality of VGAM140 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM140 RNA, herein designated VGAM RNA, and which when bound by VGAM140 RNA causes inhibition of translation of respective one or more VGAM140 host target proteins.

[4074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM140 gene, herein designated VGAM GENE, on one or

more VGAM140 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4075] It is yet further appreciated that a function of VGAM140 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM140 correlate with, and may be deduced from, the identity of the host target genes which VGAM140 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [4076] Nucleotide sequences of the VGAM140 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM140 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM140 are further described hereinbelow with reference to Table 1.
- [4077] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM140 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM140 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [4078] As mentioned hereinabove with reference to Fig. 1, a function of VGAM140 gene, herein designated VGAM is inhibition of expression of VGAM140 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM140 correlate with, and may be deduced from, the identity of the target genes which VGAM140 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [4079] Methyl-CpG Binding Domain Protein 1 (MBD1, Accession

NM_002384) is a VGAM140 host target gene. MBD1 BINDING SITE1 through MBD1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MBD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD1 BINDING SITE1 through MBD1 BINDING SITE4, designated SEQ ID:924, SEQ ID:1644, SEQ ID:1645 and SEQ ID:1646 respectively, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:475.

[4080] A function of VGAM140 is therefore inhibition of Methyl-CpG Binding Domain Protein 1 (MBD1, Accession NM_002384), a gene which bind specifically to methylated DNA via a methyl-CpG-binding domain (MBD). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD1. The function of MBD1 has been established by previous studies. Attempts to understand how DNA methylation prevents transcription have centered on 2 alternative mechanisms: direct interference of site-specific methylation with the binding of essential transcription factors, and indirect interference of promoter-

proximal methylation with transcription via a protein that binds to methylated DNA. Methyl-CpG-binding protein-1 (MECP1) binds to a variety of methylated sequences in vitro, provided they contain at least 12 symmetrically methylated CpGs. MECP1 has been detected in crude nuclear extracts. Boyes and Bird (1991) and Levine et al. (1991) presented evidence suggesting that the MECP1 protein is a mediator of repression. Methylation of cytosines within the sequence CpG is essential for mouse development and has been linked to transcriptional suppression in vertebrate systems. Methyl-CpG-binding proteins MECP1 and MECP2 (OMIM Ref. No. 300005) bind preferentially to methylated DNA and can inhibit transcription. The rat Mecp2 gene was cloned by Nan et al. (1993) and its methyl-CpG-binding domain (MBD) defined. By searching DNA sequence databases with the MBD sequence, Cross et al. (1997) identified a human cDNA with potential to encode an MBD-like region. Sequencing of the complete cDNA revealed that the open reading frame also encodes 2 cysteine-rich domains that were found in animal DNA methyltransferases (see OMIM Ref. No. DNMT; 126375) and in the mammalian HRX protein, also known as MLL and ALL-1 (OMIM Ref. No. 159555).

They designated the protein PCM1 for 'protein containing MBD.' Expressed in bacteria, it showed specific binding to methylated DNA. PCM1 also repressed transcription in vitro in a methylation-dependent manner. A polyclonal antibody raised against the protein was able to bind the native MECP1 complex from HeLa cells, indicating that PCM1 is a component of mammalian MECP1. Using PCR on a hybrid panel and FISH, Hendrich et al. (1999) mapped the MBD1 gene to chromosome 18q21, 2.1 cM distal to MBD2 (OMIM Ref. No. 603547). They mapped the murine gene to chromosome 18.

[4081] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4082] Boyes, J.; Bird, A. : DNA methylation inhibits transcription indirectly via a methyl-CpG binding protein. Cell 64: 1123–1134, 1991. ; and

[4083] Levine, A.; Cantoni, G. L.; Razin, A. : Inhibition of promoter activity by methylation: possible involvement of protein mediators. Proc. Nat. Acad. Sci. 88: 6515–6518, 1991.

[4084] Further studies establishing the function and utilities of MBD1 are found in John Hopkins OMIM database record ID

156535, and in cited publications numbered 500–50 and 3056–3058 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC51026 (Accession NM_016072) is another VGAM140 host target gene. LOC51026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51026 BINDING SITE, designated SEQ ID:1659, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:475.

[4085] Another function of VGAM140 is therefore inhibition of LOC51026 (Accession NM_016072). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 141 (VGAM141) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[4086] VGAM141 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM141 was detected is described hereinabove with reference to Figs. 1–8.

[4087] VGAM141 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM141 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4088] VGAM141 gene encodes a VGAM141 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM141 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM141 precursor RNA is designated SEQ ID:127, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:127 is located at position 62395 relative to the genome of Vaccinia Virus.

[4089] VGAM141 precursor RNA folds onto itself, forming VGAM141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[4090] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM141 folded precursor RNA into VGAM141 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 70%) nucleotide se-
quence of VGAM141 RNA is designated SEQ ID:476, and is
provided hereinbelow with reference to the sequence list-
ing part.

[4091] VGAM141 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM141 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM141 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[4092] VGAM141 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM141 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM141 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM141 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM141 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4093] The complementary binding of VGAM141 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM141 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM141 host target RNA into VGAM141 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4094] It is appreciated that VGAM141 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM141 host target genes. The mRNA of each one of this plurality of VGAM141 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM141 RNA, herein designated VGAM RNA, and which when bound by VGAM141 RNA causes inhibition of translation of respective one or more VGAM141 host target proteins.

[4095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM141 gene, herein designated VGAM GENE, on one or more VGAM141 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4096] It is yet further appreciated that a function of VGAM141 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM141 correlate with, and may be deduced from, the identity of the host target genes which VGAM141 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4097] Nucleotide sequences of the VGAM141 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM141 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM141 are further described hereinbelow with reference to Table 1.

[4098] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM141 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM141 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4099] As mentioned hereinabove with reference to Fig. 1, a function of VGAM141 gene, herein designated VGAM is inhibition of expression of VGAM141 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM141 correlate with, and may be deduced from, the identity of the target genes which VGAM141 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4100] Activation-induced Cytidine Deaminase (AICDA, Accession NM_020661) is a VGAM141 host target gene. AICDA BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by AICDA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AICDA BINDING SITE, designated SEQ ID:1923, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4101] A function of VGAM141 is therefore inhibition of Activation-induced Cytidine Deaminase (AICDA, Accession NM_020661), a gene which is a member of the cytidine deaminase family. Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AICDA. The function of AICDA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM31. Glucagon (GCG, Accession NM_002054) is another VGAM141 host target gene. GCG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GCG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCG BINDING

SITE, designated SEQ ID:895, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4102] Another function of VGAM141 is therefore inhibition of Glucagon (GCG, Accession NM_002054). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCG. Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827) is another VGAM141 host target gene. PTPN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN1 BINDING SITE, designated SEQ ID:960, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4103] Another function of VGAM141 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827), a gene which is a non-receptor type 1 protein tyrosine phosphatase and inhibits insulin signaling. Accordingly, utilities of VGAM141 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN1. The function of PTPN1 has been established by previous studies. PTP1B inhibits insulin signaling and, when overexpressed, plays a role in insulin resistance (Ahmad et al., 1997). In the 3-prime untranslated region of the PTP1B gene, Di Paola et al. (2002) identified a 1484insG variation (176885.0001) that, in 2 different populations, was associated with several features of insulin resistance. Similar data were obtained in a family-based association study by use of sib pairs discordant for genotype (Gu et al., 2000). Subjects carrying the 1484insG variant showed PTP1B mRNA overexpression in skeletal muscle. PTP1B mRNA stability was significantly higher in human embryonic kidney cells transfected with 1484insG PTP1B as compared with those transfected with wildtype PTP1B. The data indicated that the 1484insG allele causes PTP1B overexpression and plays a role in insulin resistance. Therefore, individuals carrying the 1484insG variant might particularly benefit from PTP1B inhibitors in the treatment of insulin resistance (Kennedy and Ramachandran, 2000). Animal model experiments lend further support to the function of PTPN1. Elchebly et al. (1999) generated PTP1B-deficient

mice by targeted disruption of the mouse homolog of the PTP1B gene. Mice were phenotypically and pathologically normal and had normal life span. In the fed state, homozygous mutant mice had slightly lower blood glucose concentrations, and half the circulating insulin concentrations, of wildtype littermates. The enhanced insulin sensitivity of PTP1B-deficient mice was also evident in glucose- and insulin-tolerance tests. After insulin injection, deficient mice showed increased phosphorylation of the insulin receptor in liver and muscle tissue compared to wildtype mice. On a high-fat diet, PTP1B-deficient mice were resistant to weight gain and remained insulin sensitive, while wildtype mice rapidly gained weight and became insulin resistant. These results suggested a major role for PTP1B in modulation of insulin sensitivity and fuel metabolism. The authors proposed PTP1B as a potential therapeutic target for the treatment of type 2 diabetes and obesity.

[4104] It is appreciated that the abovementioned animal model for PTPN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4105] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [4106] Elchebly, M.; Payette, P.; Michaliszyn, E.; Cromlish, W.; Collins, S.; Loy, A. L.; Normandin, D.; Cheng, A.; Himms-Hagen, J.; Chan, C.-C.; Ramachandran, C.; Gresser, M. J.; Tremblay, M. L.; Kennedy, B. P. : Increased insulin sensitivity and obesity resistance in mice lacking the protein tyrosine phosphatase-1B gene. *Science* 283: 1544-1548, 1999. ; and
- [4107] Di Paola, R.; Frittitta, L.; Miscio, G.; Bozzali, M.; Baratta, R.; Centra, M.; Spampinato, D.; Santagati, M. G.; Ercolino, T.; Cisternino, C.; Soccio, T. Mastroianno, S.; Tassi, V.; Alm.
- [4108] Further studies establishing the function and utilities of PTPN1 are found in John Hopkins OMIM database record ID 176885, and in cited publications numbered 2505-2508, 2448-2405, 2499, 240 and 2409 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SCO Cytochrome Oxidase Deficient Homolog 2 (yeast) (SCO2, Accession NM_005138) is another VGAM141 host target gene. SCO2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCO2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCO2 BINDING SITE, designated SEQ ID:1189, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4109] Another function of VGAM141 is therefore inhibition of SCO Cytochrome Oxidase Deficient Homolog 2 (yeast) (SCO2, Accession NM_005138). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCO2. Uracil-DNA Glycosylase (UNG, Accession NM_080911) is another VGAM141 host target gene. UNG BINDING SITE1 and UNG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UNG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNG BINDING SITE1 and UNG BINDING SITE2, designated SEQ ID:2394 and SEQ ID:1013 respectively, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4110] Another function of VGAM141 is therefore inhibition of Uracil-DNA Glycosylase (UNG, Accession NM_080911), a

gene which excises uracil residues from the dna to prevent mutagenesis and initiate the base-excision repair (BER) pathway. Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNG. The function of UNG has been established by previous studies. Uracil DNA glycosylase removes uracil in DNA resulting from deamination of cytosine or replicative incorporation of dUMP instead of dTMP (Haug et al., 1996). Animal model experiments lend further support to the function of UNG. Nilsen et al. (2000) generated knockout mice lacking Ung. In contrast to Ung – mutants of bacteria and yeast, these mice did not exhibit a greatly increased spontaneous mutation frequency. There was, however, only slow removal of uracil from misincorporated dUMP in isolated Ung –/– nuclei and an elevated steady-state level of uracil in DNA in dividing Ung –/– cells. A backup uracil-excising activity in tissue extracts from Ung null mice, with properties indistinguishable from the mammalian SMUG1 DNA glycosylase, may account for the repair of premutagenic U:G mispairs resulting from cytosine deamination in vivo. The authors suggested that the nuclear UNG protein has evolved a specialized role in mammalian cells counteract–

ing U:A base pairs formed by use of dUTP during DNA synthesis.

[4111] It is appreciated that the abovementioned animal model for UNG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4112] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4113] Haug, T.; Skorpen, F.; Kvaloy, K.; Eftedal, I.; Lund, H.; Krokan, H. E. : Human uracil–DNA glycosylase gene: sequence organization, methylation pattern, and mapping to chromosome 12q23–q24.1. *Genomics* 36: 408–416, 1996. ; and

[4114] Nilsen, H.; Rosewell, I.; Robins, P.; Skjelbred, C. F.; Andersen, S.; Slupphaug, G.; Daly, G.; Krokan, H. E.; Lindahl, T.; Barnes, D. E. : Uracil–DNA glycosylase (UNG)–deficient mice rev.

[4115] Further studies establishing the function and utilities of UNG are found in John Hopkins OMIM database record ID 191525, and in cited publications numbered 3036–3043 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP761G1913

(Accession NM_031474) is another VGAM141 host target gene. DKFZP761G1913 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761G1913, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761G1913 BINDING SITE, designated SEQ ID:2209, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4116] Another function of VGAM141 is therefore inhibition of DKFZP761G1913 (Accession NM_031474). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761G1913. KIAA0057 (Accession NM_012288) is another VGAM141 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:1422, to the nucleotide sequence of VGAM141 RNA, herein designated

VGAM RNA, also designated SEQ ID:476.

[4117] Another function of VGAM141 is therefore inhibition of KIAA0057 (Accession NM_012288). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. RTC Domain Containing 1 (RTCD1, Accession NM_003729) is another VGAM141 host target gene. RTCD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RTCD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTCD1 BINDING SITE, designated SEQ ID:1053, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4118] Another function of VGAM141 is therefore inhibition of RTC Domain Containing 1 (RTCD1, Accession NM_003729). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTCD1. LOC127396 (Accession XM_059139) is another VGAM141 host target gene. LOC127396 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by LOC127396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127396 BINDING SITE, designated SEQ ID:3005, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4119] Another function of VGAM141 is therefore inhibition of LOC127396 (Accession XM_059139). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127396. LOC130074 (Accession XM_072228) is another VGAM141 host target gene. LOC130074 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:3044, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4120] Another function of VGAM141 is therefore inhibition of

LOC130074 (Accession XM_072228). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC149134 (Accession XM_097594) is another VGAM141 host target gene. LOC149134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149134 BINDING SITE, designated SEQ ID:3308, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4121] Another function of VGAM141 is therefore inhibition of LOC149134 (Accession XM_097594). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149134. LOC219818 (Accession XM_165589) is another VGAM141 host target gene. LOC219818 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC219818 BINDING SITE, designated SEQ ID:3503, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4122] Another function of VGAM141 is therefore inhibition of LOC219818 (Accession XM_165589). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219818. LOC256714 (Accession XM_172798) is another VGAM141 host target gene. LOC256714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256714 BINDING SITE, designated SEQ ID:3702, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4123] Another function of VGAM141 is therefore inhibition of LOC256714 (Accession XM_172798). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256714. LOC91149 (Accession XM_036480) is an-

other VGAM141 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:2714, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:476.

[4124] Another function of VGAM141 is therefore inhibition of LOC91149 (Accession XM_036480). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 142 (VGAM142) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4125] VGAM142 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM142 was detected is described

hereinabove with reference to Figs. 1–8.

[4126] VGAM142 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM142 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4127] VGAM142 gene encodes a VGAM142 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM142 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM142 precursor RNA is designated SEQ ID:128, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:128 is located at position 67919 relative to the genome of Vaccinia Virus.

[4128] VGAM142 precursor RNA folds onto itself, forming VGAM142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4129] An enzyme complex designated DICER COMPLEX, `dices` the VGAM142 folded precursor RNA into VGAM142 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM142 RNA is designated SEQ ID:477, and is provided hereinbelow with reference to the sequence listing part.

[4130] VGAM142 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM142 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM142 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4131] VGAM142 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM142 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM142 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM142 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM142 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4132] The complementary binding of VGAM142 RNA, herein designated VGAM RNA, to host target binding sites on VGAM142 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM142 host target RNA into VGAM142 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4133] It is appreciated that VGAM142 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM142 host target genes. The mRNA of each one of this plurality of VGAM142 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM142 RNA, herein designated VGAM RNA, and which when bound by VGAM142 RNA causes inhibition of translation of respective one or more VGAM142 host target proteins.

[4134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM142 gene, herein designated VGAM GENE, on one or more VGAM142 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4135] It is yet further appreciated that a function of VGAM142 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM142 correlate with, and may be deduced from, the identity of the host target genes which VGAM142 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4136] Nucleotide sequences of the VGAM142 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM142 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM142 are further described hereinbelow with reference to Table 1.

[4137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM142 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM142 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4138] As mentioned hereinabove with reference to Fig. 1, a function of VGAM142 gene, herein designated VGAM is inhibition of expression of VGAM142 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM142 correlate with, and may be deduced from, the identity of the target genes which VGAM142 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4139] Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM_001609) is a VGAM142 host target gene. ACADSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACADSB, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:838, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4140] A function of VGAM142 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM_001609). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB. Ectodysplasin 1, Anhidrotic Receptor (EDAR, Accession NM_022336) is another VGAM142 host target gene. EDAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDAR BINDING SITE, designated SEQ ID:1985, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4141] Another function of VGAM142 is therefore inhibition of Ectodysplasin 1, Anhidrotic Receptor (EDAR, Accession

NM_022336). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDAR. MAX Protein (MAX, Accession NM_145112) is another VGAM142 host target gene. MAX BINDING SITE1 and MAX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAX BINDING SITE1 and MAX BINDING SITE2, designated SEQ ID:2515 and SEQ ID:923 respectively, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4142] Another function of VGAM142 is therefore inhibition of MAX Protein (MAX, Accession NM_145112), a gene which interacts specifically with the MYC (190080) protein . Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAX. The function of MAX has been established by previous studies. The MAX gene encodes a protein that interacts specifically with the MYC (OMIM Ref. No. 190080) protein to form a heterodimer with high

affinity for the specific cognate DNA binding site of MYC. Wagner et al. (1992) demonstrated that 2 species of RNA hybridized specifically to a MAX cDNA probe in all human and murine cell lines tested. Unlike MYC, the steady state level of MAX RNA was not significantly modulated with respect to proliferation or differentiation. Unlike MYC RNA, MAX RNA was relatively stable with a half-life of more than 3 hours, and therefore it did not exhibit the characteristic short half-life of RNAs encoded by most immediate early genes. The predicted tertiary structure of MAX closely resembles that of MYC, and it was on the basis of the basic/helix-loop-helix/leucine-zipper homology that Prendergast et al. (1991) cloned the cDNA encoding MAX. Zervos et al. (1995) described MIX2 (OMIM Ref. No. 600601), a protein that interacts with the MAX protein. Grandori et al. (1996) identified DDX18 (OMIM Ref. No. 606355) as a direct in vivo target of Myc and Max and hypothesized that Myc may exert its effects on cell behavior through proteins that affect RNA structure and metabolism. By fluorescence in situ chromosomal hybridization, Wagner et al. (1992) demonstrated that the MAX gene is located in band 14q23. This region of chromosome 14 is involved in deletions in B-cell chronic lym-

phocytic leukemia and malignant lymphomas and in the 12;14 translocation in uterine leiomyomas. Gilladoga et al. (1992) similarly mapped the MAX gene to 14q22–q24 by isotopic in situ hybridization and to mouse chromosome 12 in region D.

- [4143] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [4144] Wagner, A. J.; Le Beau, M. M.; Diaz, M. O.; Hay, N. : Expression, regulation, and chromosomal localization of the Max gene. Proc. Nat. Acad. Sci. 89: 3111–3115, 1992. ; and
- [4145] Prendergast, G. C.; Lawe, D.; Ziff, E. B. : Association of Myn, the murine homolog of Max, with c-Myc stimulates methylation-sensitive DNA binding and Ras cotransformation. Cell 65: 395–.
- [4146] Further studies establishing the function and utilities of MAX are found in John Hopkins OMIM database record ID 154950, and in cited publications numbered 686–68 and 2538–2541 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. NIMA (never in mitosis gene a)–related Kinase 4 (NEK4, Accession NM_003157) is another VGAM142 host target gene.

NEK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEK4 BINDING SITE, designated SEQ ID:995, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4147] Another function of VGAM142 is therefore inhibition of NIMA (never in mitosis gene a)-related Kinase 4 (NEK4, Accession NM_003157). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK4. Chromosome 20 Open Reading Frame 170 (C20orf170, Accession XM_029885) is another VGAM142 host target gene. C20orf170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf170 BINDING SITE, designated SEQ ID:2608, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ

ID:477.

[4148] Another function of VGAM142 is therefore inhibition of Chromosome 20 Open Reading Frame 170 (C20orf170, Accession XM_029885). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf170.

FLJ20435 (Accession NM_017821) is another VGAM142 host target gene. FLJ20435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20435 BINDING SITE, designated SEQ ID:1756, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4149] Another function of VGAM142 is therefore inhibition of FLJ20435 (Accession NM_017821). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20435. FLJ23071 (Accession NM_025192) is another VGAM142 host target gene. FLJ23071 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ23071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23071 BINDING SITE, designated SEQ ID:2143, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4150] Another function of VGAM142 is therefore inhibition of FLJ23071 (Accession NM_025192). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23071. KIAA0562 (Accession NM_014704) is another VGAM142 host target gene. KIAA0562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:1525, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4151] Another function of VGAM142 is therefore inhibition of KIAA0562 (Accession NM_014704). Accordingly, utilities

of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562. Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM_004735) is another VGAM142 host target gene. LRRFIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LRRFIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRFIP1 BINDING SITE, designated SEQ ID:1151, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4152] Another function of VGAM142 is therefore inhibition of Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM_004735). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRFIP1. P115 (Accession NM_003715) is another VGAM142 host target gene. P115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of P115 BINDING SITE, designated SEQ ID:1051, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4153] Another function of VGAM142 is therefore inhibition of P115 (Accession NM_003715). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P115.

Serologically Defined Colon Cancer Antigen 16

(SDCCAG16, Accession NM_006649) is another VGAM142 host target gene. SDCCAG16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCCAG16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG16 BINDING SITE, designated SEQ ID:1316, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4154] Another function of VGAM142 is therefore inhibition of Serologically Defined Colon Cancer Antigen 16 (SDCCAG16, Accession NM_006649). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SD-CCAG16. TGFB1-induced Anti-apoptotic Factor 1 (TIAF1, Accession NM_078471) is another VGAM142 host target gene. TIAF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAF1 BINDING SITE, designated SEQ ID:2370, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4155] Another function of VGAM142 is therefore inhibition of TGFB1-induced Anti-apoptotic Factor 1 (TIAF1, Accession NM_078471). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAF1. LOC149711 (Accession XM_097720) is another VGAM142 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, desig-

nated SEQ ID:3314, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4156] Another function of VGAM142 is therefore inhibition of LOC149711 (Accession XM_097720). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC169933 (Accession XM_092989) is another VGAM142 host target gene. LOC169933 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169933 BINDING SITE, designated SEQ ID:3251, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:477.

[4157] Another function of VGAM142 is therefore inhibition of LOC169933 (Accession XM_092989). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169933. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 143 (VGAM143) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4158] VGAM143 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM143 was detected is described hereinabove with reference to Figs. 1–8.

[4159] VGAM143 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM143 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4160] VGAM143 gene encodes a VGAM143 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM143 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM143 precursor RNA is designated SEQ ID:129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:129 is located at position 69887 relative to the genome of Vac–

cinia Virus.

[4161] VGAM143 precursor RNA folds onto itself, forming VGAM143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4162] An enzyme complex designated DICER COMPLEX, `dices` the VGAM143 folded precursor RNA into VGAM143 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of VGAM143 RNA is designated SEQ ID:478, and is provided hereinbelow with reference to the sequence listing part.

[4163] VGAM143 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM143 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM143 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4164] VGAM143 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM143 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM143 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM143 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM143 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4165] The complementary binding of VGAM143 RNA, herein designated VGAM RNA, to host target binding sites on VGAM143 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM143 host target RNA into VGAM143 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4166] It is appreciated that VGAM143 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM143 host target genes. The mRNA of each one of this plurality of VGAM143 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM143 RNA, herein designated VGAM RNA, and which when bound by VGAM143 RNA causes inhibition of translation of respective one or more VGAM143 host target proteins.

[4167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM143 gene, herein designated VGAM GENE, on one or more VGAM143 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4168] It is yet further appreciated that a function of VGAM143 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM143 correlate

with, and may be deduced from, the identity of the host target genes which VGAM143 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4169] Nucleotide sequences of the VGAM143 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM143 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM143 are further described hereinbelow with reference to Table 1.

[4170] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM143 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM143 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4171] As mentioned hereinabove with reference to Fig. 1, a function of VGAM143 gene, herein designated VGAM is inhibition of expression of VGAM143 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM143 correlate with, and may be deduced

from, the identity of the target genes which VGAM143 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4172] Sorting Nexin 9 (SNX9, Accession NM_016224) is a VGAM143 host target gene. SNX9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX9 BINDING SITE, designated SEQ ID:1673, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:478.

[4173] A function of VGAM143 is therefore inhibition of Sorting Nexin 9 (SNX9, Accession NM_016224). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX9. TOX (Accession NM_014729) is another VGAM143 host target gene. TOX BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of TOX BINDING SITE, designated SEQ ID:1533, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:478.

[4174] Another function of VGAM143 is therefore inhibition of TOX (Accession NM_014729). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOX. DKFZP434C212 (Accession XM_044196) is another VGAM143 host target gene. DKFZP434C212 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:2833, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:478.

[4175] Another function of VGAM143 is therefore inhibition of DKFZP434C212 (Accession XM_044196). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212. LOC151438 (Accession XM_098060)

is another VGAM143 host target gene. LOC151438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:3345, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:478.

[4176] Another function of VGAM143 is therefore inhibition of LOC151438 (Accession XM_098060). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438. LOC221663 (Accession XM_168131) is another VGAM143 host target gene. LOC221663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221663 BINDING SITE, designated SEQ ID:3619, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:478.

[4177] Another function of VGAM143 is therefore inhibition of LOC221663 (Accession XM_168131). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221663. LOC257358 (Accession XM_173138) is another VGAM143 host target gene. LOC257358 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257358 BINDING SITE, designated SEQ ID:3730, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:478.

[4178] Another function of VGAM143 is therefore inhibition of LOC257358 (Accession XM_173138). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257358. LOC56832 (Accession XM_035950) is another VGAM143 host target gene. LOC56832 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56832, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56832 BINDING SITE, designated SEQ ID:2703, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:478.

[4179] Another function of VGAM143 is therefore inhibition of LOC56832 (Accession XM_035950). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56832. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 144 (VGAM144) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4180] VGAM144 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM144 was detected is described hereinabove with reference to Figs. 1–8.

[4181] VGAM144 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM144 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[4182] VGAM144 gene encodes a VGAM144 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM144 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM144 precursor RNA is designated SEQ ID:130, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:130 is located at position 68429 relative to the genome of Vaccinia Virus.

[4183] VGAM144 precursor RNA folds onto itself, forming VGAM144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4184] An enzyme complex designated DICER COMPLEX, `dices` the VGAM144 folded precursor RNA into VGAM144 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM144 RNA is designated SEQ ID:479, and is provided hereinbelow with reference to the sequence listing part.

[4185] VGAM144 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM144 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4186] VGAM144 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM144 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM144 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4187] The complementary binding of VGAM144 RNA, herein designated VGAM RNA, to host target binding sites on VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM144 host target RNA into VGAM144 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[4188] It is appreciated that VGAM144 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM144 host target genes. The mRNA of each one of this plurality of VGAM144 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM144 RNA, herein designated VGAM RNA, and which when bound by VGAM144 RNA causes inhibition of translation of respective one or more VGAM144 host target proteins.

[4189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM144 gene, herein designated VGAM GENE, on one or more VGAM144 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4190] It is yet further appreciated that a function of VGAM144 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM144 correlate with, and may be deduced from, the identity of the host target genes which VGAM144 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4191] Nucleotide sequences of the VGAM144 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM144 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM144 are further described hereinbelow with reference to Table 1.

[4192] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM144 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM144 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4193] As mentioned hereinabove with reference to Fig. 1, a function of VGAM144 gene, herein designated VGAM is inhibition of expression of VGAM144 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM144 correlate with, and may be deduced from, the identity of the target genes which VGAM144 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4194] SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM_000346) is a VGAM144 host target gene. SOX9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX9 BINDING SITE, designated SEQ ID:732, to the nucleotide

sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4195] A function of VGAM144 is therefore inhibition of SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM_000346), a gene which regulates the expression of other genes involved in chondrogenesis. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX9. The function of SOX9 has been established by previous studies. Murakami et al. (2000) showed that expression of Sox9 is upregulated by fibroblast growth factors (FGFs; OMIM Ref. No. 601513) in primary chondrocytes and in Sox9-expressing mesenchymal cells. They further presented evidence that FGF stimulation of Sox9 expression is mediated by the mitogen-activated protein kinase (MAPK) cascade (see OMIM Ref. No. 176948) a signal transduction pathway that is activated by growth factors such as FGF. The data strongly suggested that FGF and the MAPK pathway play an important role in the regulation of Sox9 expression during chondrocyte differentiation, Bi et al. (2001) proposed that Sox9 also has a role in regulating the transition to hypertrophic chondrocytes in the

growth plate. Despite the severe hypoplasia of cartilages, the overall organization and cellular composition of the growth plate were otherwise normal. The results suggested that 2 critical steps of the chondrocyte differentiation pathway are sensitive to Sox9 dosage: an early step presumably at the stage of mesenchymal condensation of cartilage primordia, and a later step preceding the transition of chondrocytes into hypertrophic chondrocytes.

[4196] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4197] Murakami, S.; Kan, M.; McKeehan, W. L.; de Crombrughe, B. : Up-regulation of the chondrogenic Sox9 gene by fibroblast growth factors is mediated by the mitogen-activated protein kinase pathway. Proc. Nat. Acad. Sci. 97: 1113-1118, 2000. ; and

[4198] Bi, W.; Huang, W.; Whitworth, D. J.; Deng, J. M.; Zhang, Z.; Behringer, R. R.; de Crombrughe, B. : Haploinsufficiency of Sox9 results in defective cartilage primordia and premature skelet.

[4199] Further studies establishing the function and utilities of SOX9 are found in John Hopkins OMIM database record ID 114290, and in cited publications numbered 2837-2851,

2851, 2852–2859, 2526, 2871–2877, 2719, 2878–2893, 2956–2899, 2836, 2900–290 and 2812–2813 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ14356 (Accession NM_030824) is another VGAM144 host target gene. FLJ14356 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14356 BINDING SITE, designated SEQ ID:2171, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4200] Another function of VGAM144 is therefore inhibition of FLJ14356 (Accession NM_030824). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14356. KIAA0982 (Accession NM_014023) is another VGAM144 host target gene. KIAA0982 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0982 BINDING SITE, designated SEQ ID:1464, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4201] Another function of VGAM144 is therefore inhibition of KIAA0982 (Accession NM_014023). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0982. KIAA1028 (Accession XM_166324) is another VGAM144 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:3546, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4202] Another function of VGAM144 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1028. PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM_015889) is another VGAM144 host target gene. PC-QAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCQAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCQAP BINDING SITE, designated SEQ ID:1649, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4203] Another function of VGAM144 is therefore inhibition of PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM_015889). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCQAP. Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531) is another VGAM144 host target gene. PRKWNK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKWNK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:3488, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4204] Another function of VGAM144 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2. RCD-8 (Accession NM_014329) is another VGAM144 host target gene. RCD-8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RCD-8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCD-8 BINDING SITE, designated SEQ ID:1491, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4205] Another function of VGAM144 is therefore inhibition of RCD-8 (Accession NM_014329). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCD-8.

SMOC2 (Accession XM_051452) is another VGAM144 host target gene. SMOC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC2 BINDING SITE, designated SEQ ID:2945, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4206] Another function of VGAM144 is therefore inhibition of SMOC2 (Accession XM_051452). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC2. Synaptojanin 2 (SYNJ2, Accession XM_029746) is another VGAM144 host target gene. SYNJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNJ2 BINDING SITE, designated SEQ ID:2605, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:479.

[4207] Another function of VGAM144 is therefore inhibition of Synaptojanin 2 (SYNJ2, Accession XM_029746). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2. TRABID (Accession XM_043669) is another VGAM144 host target gene. TRABID BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRABID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRABID BINDING SITE, designated SEQ ID:2823, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4208] Another function of VGAM144 is therefore inhibition of TRABID (Accession XM_043669). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRABID. Testis Specific, 14 (TSGA14, Accession NM_018718) is another VGAM144 host target gene. TSGA14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSGA14, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSGA14 BINDING SITE, designated SEQ ID:1861, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4209] Another function of VGAM144 is therefore inhibition of Testis Specific, 14 (TSGA14, Accession NM_018718). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSGA14. LOC197201 (Accession XM_113839) is another VGAM144 host target gene. LOC197201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:3421, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4210] Another function of VGAM144 is therefore inhibition of LOC197201 (Accession XM_113839). Accordingly, utilities

of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201. LOC219401 (Accession XM_166706) is another VGAM144 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:3579, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:479.

[4211] Another function of VGAM144 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 145 (VGAM145) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4212] VGAM145 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM145 was detected is described hereinabove with reference to Figs. 1–8.

[4213] VGAM145 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM145 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4214] VGAM145 gene encodes a VGAM145 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM145 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM145 precursor RNA is designated SEQ ID:131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:131 is located at position 67126 relative to the genome of Vaccinia Virus.

[4215] VGAM145 precursor RNA folds onto itself, forming VGAM145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4216] An enzyme complex designated DICER COMPLEX, `dices` the VGAM145 folded precursor RNA into VGAM145 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM145 RNA is designated SEQ ID:480, and is provided hereinbelow with reference to the sequence listing part.

[4217] VGAM145 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM145 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[4218] VGAM145 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM145 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM145 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4219] The complementary binding of VGAM145 RNA, herein designated VGAM RNA, to host target binding sites on VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM145 host target RNA into VGAM145 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4220] It is appreciated that VGAM145 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM145 host target genes. The mRNA of each one of this plurality of VGAM145 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM145 RNA, herein designated VGAM RNA, and which when bound by VGAM145 RNA causes inhibition of translation of respective one or more VGAM145 host target proteins.

[4221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM145 gene, herein designated VGAM GENE, on one or more VGAM145 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4222] It is yet further appreciated that a function of VGAM145 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM145 correlate with, and may be deduced from, the identity of the host target genes which VGAM145 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4223] Nucleotide sequences of the VGAM145 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM145 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM145 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM145 are further
described hereinbelow with reference to Table 1.

[4224] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM145 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM145 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[4225] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM145 gene, herein designated VGAM is
inhibition of expression of VGAM145 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM145 correlate with, and may be deduced
from, the identity of the target genes which VGAM145
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[4226] Inhibin, Beta A (activin A, activin AB alpha polypeptide)
(INHBA, Accession NM_002192) is a VGAM145 host target

gene. INHBA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INHBA BINDING SITE, designated SEQ ID:904, to the nucleotide sequence of VGAM145 RNA, herein designated VGAM RNA, also designated SEQ ID:480.

[4227] A function of VGAM145 is therefore inhibition of Inhibin, Beta A (activin A, activin AB alpha polypeptide) (INHBA, Accession NM_002192), a gene which inhibit respectively the secretion of follitropin by the pituitary gland. Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBA. The function of INHBA has been established by previous studies. From the culture fluid of a human transformed cell line (THB-1) stimulated by phorbol 12-myristate 13-acetate, Murata et al. (1988) isolated a protein that exhibited potent differentiation-inducing activity toward mouse Friend erythroleukemia cells and human K-562 cells. Designated erythroid differentiation factor (EDF), the protein is a homodimer with a molecular weight of 25,000. Surprisingly, the sequence of EDF mRNA

was found to be identical to that of the beta-A subunit of inhibin. Southern blot analysis indicated that only 1 gene for EDF/inhibin beta-A exists in the human genome. The follicle-stimulating hormone (FSH)-releasing protein (FRP) subunit is likewise identical in structure to the beta-A subunit of inhibin. Lumpkin et al. (1987) purified from sheep hypothalamus a fraction (presumably a peptide) that had selective FSH-releasing properties. They demonstrated dissimilarity of the purified factor from luteinizing hormone-releasing hormone (OMIM Ref. No. 152760).

You and Kruse (2002) studied corneal myofibroblast differentiation and signal transduction induced by the transforming growth factor-beta (TGFB) family members activin A and bone morphogenetic protein-7 (BMP7; 112267). They found that activin A induced phosphorylation of SMAD2 (OMIM Ref. No. 601366), and BMP7 induced SMAD1 (OMIM Ref. No. 601595), both of which were inhibited by follistatin (OMIM Ref. No. 136470). Transfection with antisense SMAD2/SMAD3 (OMIM Ref. No. 603109) prevented activin-induced expression and accumulation of alpha-smooth muscle actin. The authors concluded that TGFB proteins have different functions in the cornea. Activin A and TGFB1, but not BMP7, are regulators of ker-

atocyte differentiation and might play a role during myofibroblast transdifferentiation. SMAD2/SMAD3 signal transduction appeared to be important in the regulation of muscle-specific genes. Animal model experiments lend further support to the function of INHBA. The activins, dimers of beta-A or beta-B subunits encoded by the genes *Inhba* and *Inhbb*, respectively, are TGF-beta superfamily members that have roles in reproduction and development. Whereas mice homozygous for the *Inhba*-null allele demonstrate disruption of whisker, palate, and tooth development leading to neonatal lethality, homozygous *Inhbb*-null mice are viable, fertile, and have eye defects. To determine if these phenotypes were due to spatiotemporal expression differences of the ligands or disruption of specific ligand-receptor interactions, Brown et al. (2000) replaced the region of *Inhba* encoding the mature protein with *Inhbb*, creating the allele designated *Inhba*(BK). Although the craniofacial phenotypes of the *Inhba*-null mutation were rescued by the *Inhba*(BK) allele, somatic, testicular, genital, and hair growth were grossly affected and influenced by the dosage and bioactivity of the allele. Thus, Brown et al. (2000) concluded that functional compensation within the TGF-beta superfamily can

occur if the replacement gene is expressed appropriately. The novel phenotypes in these mice further illustrate the usefulness of insertion strategies for defining protein function. The structural organization of the testes of adult *Inhba*(BK/BK) mice was normal; however, the differentiation of the seminiferous tubules of *Inhba*(BK/–) mice was delayed. The testicular volumes of both *Inhba*(BK/BK) and *Inhba*(BK/–) mice were less than those of controls, and the dosage of the *Inhba*(BK) allele correlated positively with testicular size. *Inhba*(+/BK) males had normal onset of fertility, whereas *Inhba*(BK/BK) males had delayed onset of fertility similar to *Acvr2* (OMIM Ref. No. 102581) –/– mice. Only 1 in 6 *Inhba*(BK/BK) females produced litters, whereas *Inhba*(+/BK) females were normally fertile. The ovaries of *Inhba*(BK/–) mice were smaller and contained fewer large preantral follicles than those of controls. *Inhba*(BK/BK) and *Inhba*(BK/–) mice were identified by their smaller size, slower hair growth, the rough appearance of their fur, and sunken eyes. Approximately 50% of *Inhba*(BK/BK) mice died by 26 weeks, whereas *Inhba*(BK/–) mice invariably became cachectic and died between 3 and 4 weeks. The summary of phenotypic findings of *Inhba*(BK/–) mice includes short whiskers, normal tooth de-

velopment, no cleft palate, symmetric growth deficiency (OMIM Ref. No. severe), enlargement of external genitalia, hypogonadism (OMIM Ref. No. severe), delayed hair growth (moderate), hypoglycemia (mild), decreased life expectancy (OMIM Ref. No. severe), and anemia

[4228] It is appreciated that the abovementioned animal model for INHBA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4229] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4230] Brown, C. W.; Houston-Hawkins, D. E.; Woodruff, T. K.; Matzuk, M. M. : Insertion of *Inhbb* into the *Inhba* locus rescues the *Inhba*-null phenotype and reveals new activin functions. *Nature Genet.* 25: 453-457, 2000. ; and

[4231] Murata, M.; Eto, Y.; Shibai, H.; Sakai, M.; Muramatsu, M. : Erythroid differentiation factor is encoded by the same mRNA as that of the inhibin beta-A chain. *Proc. Nat. Acad. Sci.* 85: 2.

[4232] Further studies establishing the function and utilities of INHBA are found in John Hopkins OMIM database record ID 147290, and in cited publications numbered 1190, 119

and 1193–1197 listed in the bibliography section herein–
below, which are also hereby incorporated by refer–
ence. Thromboxane A Synthase 1 (platelet, cytochrome
P450, subfamily V) (TBXAS1, Accession NM_030984) is
another VGAM145 host target gene. TBXAS1 BINDING
SITE1 and TBXAS1 BINDING SITE2 are HOST TARGET bind–
ing sites found in untranslated regions of mRNA encoded
by TBXAS1, corresponding to HOST TARGET binding sites
such as BINDING SITE I, BINDING SITE II or BINDING SITE III.
Table 2 illustrates the complementarity of the nucleotide
sequences of TBXAS1 BINDING SITE1 and TBXAS1 BINDING
SITE2, designated SEQ ID:2182 and SEQ ID:798 respec–
tively, to the nucleotide sequence of VGAM145 RNA,
herein designated VGAM RNA, also designated SEQ
ID:480.

[4233] Another function of VGAM145 is therefore inhibition of
Thromboxane A Synthase 1 (platelet, cytochrome P450,
subfamily V) (TBXAS1, Accession NM_030984). Accord–
ingly, utilities of VGAM145 include diagnosis, prevention
and treatment of diseases and clinical conditions associ–
ated with TBXAS1. LOC197342 (Accession XM_113869) is
another VGAM145 host target gene. LOC197342 BINDING
SITE is HOST TARGET binding site found in the 3` un–

translated region of mRNA encoded by LOC197342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:3424, to the nucleotide sequence of VGAM145 RNA, herein designated VGAM RNA, also designated SEQ ID:480.

[4234] Another function of VGAM145 is therefore inhibition of LOC197342 (Accession XM_113869). Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342. LOC91752 (Accession XM_040403) is another VGAM145 host target gene. LOC91752 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91752 BINDING SITE, designated SEQ ID:2779, to the nucleotide sequence of VGAM145 RNA, herein designated VGAM RNA, also designated SEQ ID:480.

[4235] Another function of VGAM145 is therefore inhibition of LOC91752 (Accession XM_040403). Accordingly, utilities

of VGAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91752. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 146 (VGAM146) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4236] VGAM146 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM146 was detected is described hereinabove with reference to Figs. 1–8.

[4237] VGAM146 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM146 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4238] VGAM146 gene encodes a VGAM146 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM146 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM146 precursor RNA is designated SEQ ID:132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:132 is located at position 69412 relative to the genome of Vaccinia Virus.

[4239] VGAM146 precursor RNA folds onto itself, forming VGAM146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4240] An enzyme complex designated DICER COMPLEX, `dices` the VGAM146 folded precursor RNA into VGAM146 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM146 RNA is designated SEQ ID:481, and is

provided hereinbelow with reference to the sequence listing part.

[4241] VGAM146 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM146 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[4242] VGAM146 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM146 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM146 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4243] The complementary binding of VGAM146 RNA, herein designated VGAM RNA, to host target binding sites on VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM146 host target RNA into VGAM146 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4244] It is appreciated that VGAM146 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM146 host target genes. The mRNA of each one of this plurality of VGAM146 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM146 RNA, herein designated VGAM RNA, and which when bound by VGAM146 RNA causes inhibition of translation of respective one or more VGAM146 host target proteins.

[4245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM146 gene, herein designated VGAM GENE, on one or more VGAM146 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4246] It is yet further appreciated that a function of VGAM146 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM146 correlate with, and may be deduced from, the identity of the host target genes which VGAM146 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4247] Nucleotide sequences of the VGAM146 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM146 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM146 are further described hereinbelow with reference to Table 1.

[4248] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM146 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM146 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4249] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM146 gene, herein designated VGAM is inhibition of expression of VGAM146 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM146 correlate with, and may be deduced from, the identity of the target genes which VGAM146 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4250] FLJ11838 (Accession NM_024664) is a VGAM146 host target gene. FLJ11838 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11838 BINDING SITE, designated SEQ ID:2078, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:481.

[4251] A function of VGAM146 is therefore inhibition of FLJ11838 (Accession NM_024664). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11838. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present inven-

tion, referred to here as Viral Genomic Address Messenger 147 (VGAM147) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4252] VGAM147 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM147 was detected is described hereinabove with reference to Figs. 1–8.

[4253] VGAM147 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM147 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4254] VGAM147 gene encodes a VGAM147 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM147 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM147 precursor RNA is designated SEQ ID:133, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:133 is located at position 66394 relative to the genome of Vaccinia Virus.

[4255] VGAM147 precursor RNA folds onto itself, forming VGAM147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4256] An enzyme complex designated DICER COMPLEX, `dices` the VGAM147 folded precursor RNA into VGAM147 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM147 RNA is designated SEQ ID:482, and is provided hereinbelow with reference to the sequence listing part.

[4257] VGAM147 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM147 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM147 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4258] VGAM147 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM147 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM147 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM147 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM147 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4259] The complementary binding of VGAM147 RNA, herein designated VGAM RNA, to host target binding sites on VGAM147 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM147 host target RNA into VGAM147 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4260] It is appreciated that VGAM147 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM147 host target genes. The mRNA of each one of this plurality of VGAM147 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM147 RNA, herein designated VGAM RNA, and which when bound by VGAM147 RNA causes inhibition of translation of respective one or more VGAM147 host target proteins.

[4261] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM147 gene, herein designated VGAM GENE, on one or more VGAM147 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4262] It is yet further appreciated that a function of VGAM147 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM147 correlate with, and may be deduced from, the identity of the host

target genes which VGAM147 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4263] Nucleotide sequences of the VGAM147 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM147 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM147 are further described hereinbelow with reference to Table 1.

[4264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM147 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM147 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4265] As mentioned hereinabove with reference to Fig. 1, a function of VGAM147 gene, herein designated VGAM is inhibition of expression of VGAM147 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM147 correlate with, and may be deduced from, the identity of the target genes which VGAM147

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4266] ATP10C (Accession NM_024490) is a VGAM147 host target gene. ATP10C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10C BINDING SITE, designated SEQ ID:2062, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4267] A function of VGAM147 is therefore inhibition of ATP10C (Accession NM_024490), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10C. The function of ATP10C has been established by previous studies. Meguro et al. (2001) reported that the ATP10C gene is maternally expressed, that it maps within the most common interval of deletion responsible for Angelman syndrome (AS; 105830) (15q11-q13), and that ATP10C expression is

virtually absent from Angelman syndrome patients with imprinting mutations, as well as from patients with maternal deletions of 15q11–q13. Previously, although AS patients infrequently have mutations in the UBE3A gene (OMIM Ref. No. 601623), which encodes a ubiquitin ligase required for long-term synaptic potentiation (LTP), most cases were attributable to de novo maternal deletions of the critical 15q region. Herzing et al. (2001) reported that ATP10C maps within 200 kb distal to UBE3A and, like UBE3A, demonstrates imprinted, preferential maternal expression in human brain. They suggested that ATP10C is a candidate for chromosome 15-associated autism as well as the Angelman syndrome phenotype. Animal model experiments lend further support to the function of ATP10C. Dhar et al. (2000) reported that maternal inheritance of deletions of the mouse *Atp10c* gene resulted in increased body fat. The obese phenotype was consistently observed in the mouse model for Angelman syndrome with paternal uniparental disomy (Cattanach et al., 1997). Meguro et al. (2001) speculated that ATP10C may be an aminophospholipid translocase involved in phospholipid transport.

[4268] It is appreciated that the abovementioned animal model for ATP10C is acknowledged by those skilled in the art as

a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4269] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4270] Meguro, M.; Kashiwagi, A.; Mitsuya, K.; Nakao, M.; Kondo, I.; Saitoh, S.; Oshimura, M. : A novel maternally expressed gene, ATP10C, encodes a putative aminophospholipid translocase associated with Angelman syndrome. *Nature Genet.* 28: 19–20, 2001. ; and

[4271] Cattanach, B. M.; Barr, J. A.; Beechey, C. V.; Martin, J.; Noebels, J.; Jones, J. : A candidate model for Angelman syndrome in the mouse. *Mammalian Genome* 8: 472–478, 1997.

[4272] Further studies establishing the function and utilities of ATP10C are found in John Hopkins OMIM database record ID 605855, and in sited publications numbered 1535–1536, 2905, 156 and 1567 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Caspase 10, Apoptosis–related Cysteine Protease (CASP10, Accession NM_032976) is another VGAM147 host target gene. CASP10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by CASP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP10 BINDING SITE, designated SEQ ID:2304, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4273] Another function of VGAM147 is therefore inhibition of Caspase 10, Apoptosis-related Cysteine Protease (CASP10, Accession NM_032976), a gene which is one aspartate-specific cysteine protease and important in death receptor signaling or other cellular processes. Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP10. The function of CASP10 has been established by previous studies. Wang et al. (2001) showed that caspase-10 can function independently of caspase-8 in initiating FAS- and tumor necrosis factor-related apoptosis-inducing ligand-receptor-mediated apoptosis. Moreover, FAS crosslinking in primary human T cells leads to the recruitment and activation of caspase-10. They showed that the death-effector domains of caspases 8 and 10 interact with the death-effector domain of FADD.

Nonetheless, they found that caspases 8 and 10 may have different apoptosis substrates and therefore potentially distinct roles in death receptor signaling or other cellular processes. By a candidate gene mutation search strategy, Wang et al. (1999) identified independent missense mutations in the CASP10 gene in 2 kindreds with type II autoimmune lymphoproliferative syndrome (ALPS2; 603909) characterized by abnormal lymphocyte and dendritic cell homeostasis and immune regulatory defects. The mutations (601762.0001 and 601762.0002) resulted in amino acid substitutions that decreased caspase activity and interfered with death receptor-induced apoptosis, particularly that stimulated by Fas ligand (OMIM Ref. No. 134638) and TRAIL (OMIM Ref. No. 603598). These results provided evidence that inherited nonlethal caspase abnormalities cause pleiotropic apoptosis defects underlying autoimmunity in ALPS2. To explore the possibility that mutation in the CASP10 gene might be involved in the development of non-Hodgkin lymphoma (NHL; 605027), Shin et al. (2002) analyzed the entire coding region and all splice sites of the CASP10 gene for the detection of somatic mutations in 117 human NHLs. Seventeen NHLs (14.5%) had CASP10 mutations, of which 3 were identified

in the coding regions of the prodomain, 11 in the p17 large protease subunit, and 3 in the p12 small protease subunit. There were 2 frameshift mutations and 1 non-sense mutation; the remaining 14 were missense mutations. Shin et al. (2002) expressed the tumor-derived CASP10 mutants in 293 cells and found that apoptosis was suppressed. These data suggested that the inactivating mutations of the CASP10 gene may lead to the loss of its apoptotic function and contribute to the pathogenesis of some human NHLs.

[4274] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4275] Wang, J.; Chun, H. J.; Wong, W.; Spencer, D. M.; Lenardo, M. J. : Caspase-10 is an initiator caspase in death receptor signaling. *Proc. Nat. Acad. Sci.* 98: 13884-13888, 2001. ; and

[4276] Wang, J.; Zheng, L.; Lobito, A.; Chan, F. K.; Dale, J.; Sneller, M.; Yao, X.; Puck, J. M.; Straus, S. E.; Lenardo, M. J. : Inherited human caspase 10 mutations underlie defective lympho.

[4277] Further studies establishing the function and utilities of CASP10 are found in John Hopkins OMIM database record

ID 601762, and in cited publications numbered 1628–1561 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM_168302) is another VGAM147 host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:3627, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4278] Another function of VGAM147 is therefore inhibition of Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM137. DORFIN (Accession NM_015435) is another

VGAM147 host target gene. DORFIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DORFIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DORFIN BINDING SITE, designated SEQ ID:1630, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4279] Another function of VGAM147 is therefore inhibition of DORFIN (Accession NM_015435). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DORFIN. FLJ21313 (Accession NM_023927) is another VGAM147 host target gene. FLJ21313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21313 BINDING SITE, designated SEQ ID:2037, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4280] Another function of VGAM147 is therefore inhibition of FLJ21313 (Accession NM_023927). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21313. KIAA1819 (Accession XM_045716) is another VGAM147 host target gene. KIAA1819 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1819 BINDING SITE, designated SEQ ID:2865, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4281] Another function of VGAM147 is therefore inhibition of KIAA1819 (Accession XM_045716). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1819. P37NB (Accession NM_005824) is another VGAM147 host target gene. P37NB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P37NB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P37NB BINDING SITE, designated SEQ ID:1254, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4282] Another function of VGAM147 is therefore inhibition of P37NB (Accession NM_005824). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P37NB. RAP140 (Accession NM_015224) is another VGAM147 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:1613, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4283] Another function of VGAM147 is therefore inhibition of RAP140 (Accession NM_015224). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140.

LOC127002 (Accession XM_059107) is another VGAM147 host target gene. LOC127002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127002 BINDING SITE, designated SEQ ID:3002, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4284] Another function of VGAM147 is therefore inhibition of LOC127002 (Accession XM_059107). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127002. LOC132332 (Accession XM_072306) is another VGAM147 host target gene. LOC132332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132332 BINDING SITE, designated SEQ ID:3046, to the nucleotide sequence of VGAM147 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:482.

[4285] Another function of VGAM147 is therefore inhibition of LOC132332 (Accession XM_072306). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132332. LOC145624 (Accession XM_096824) is another VGAM147 host target gene. LOC145624 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145624 BINDING SITE, designated SEQ ID:3276, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:482.

[4286] Another function of VGAM147 is therefore inhibition of LOC145624 (Accession XM_096824). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145624. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 148 (VGAM148) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4287] VGAM148 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM148 was detected is described hereinabove with reference to Figs. 1–8.

[4288] VGAM148 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4289] VGAM148 gene encodes a VGAM148 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM148 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM148 precursor RNA is designated SEQ ID:134, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:134 is located at position 72012 relative to the genome of Vaccinia Virus.

[4290] VGAM148 precursor RNA folds onto itself, forming

VGAM148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4291] An enzyme complex designated DICER COMPLEX, `dices` the VGAM148 folded precursor RNA into VGAM148 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM148 RNA is designated SEQ ID:483, and is provided hereinbelow with reference to the sequence listing part.

[4292] VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM148 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[4293] VGAM148 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM148 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM148 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4294] The complementary binding of VGAM148 RNA, herein designated VGAM RNA, to host target binding sites on VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM148 host target RNA into VGAM148 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4295] It is appreciated that VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM148 host target genes. The mRNA of each one of this plurality of VGAM148 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM148 RNA, herein designated VGAM RNA, and which when bound by VGAM148 RNA causes inhibition of translation of respective one or more VGAM148 host target proteins.

[4296] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM148 gene, herein designated VGAM GENE, on one or more VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4297] It is yet further appreciated that a function of VGAM148 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM148 correlate with, and may be deduced from, the identity of the host target genes which VGAM148 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[4298] Nucleotide sequences of the VGAM148 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM148 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM148 are further described hereinbelow with reference to Table 1.

[4299] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM148 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM148 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4300] As mentioned hereinabove with reference to Fig. 1, a function of VGAM148 gene, herein designated VGAM is inhibition of expression of VGAM148 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM148 correlate with, and may be deduced from, the identity of the target genes which VGAM148 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[4301] Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186) is a VGAM148 host target gene. NR4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A2 BINDING SITE, designated SEQ ID:1277, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4302] A function of VGAM148 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186), a gene which may be a general coactivator of transcription. Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A2. The function of NR4A2 has been established by previous studies. Mages et al. (1994) analyzed early genetic response of human T cells following mitogenic activation and identified a gene encoding a member of the steroid/thyroid hormone family of receptors (see OMIM Ref. No. 190160).

The receptor, called NOT (nuclear receptor of T cells) by them, has all of the structural features of steroid/thyroid hormone receptors but is rapidly and only very transiently expressed after cell activation. Short-lived NOT mRNA expression was observed in vivo exclusively in the brain. The C-terminal region of the predicted 598-amino acid NOT protein shares 71% similarity with NAK1/TR3 (OMIM Ref. No. 139139), a previously identified human orphan steroid receptor. The protein sequence is 99.5% similar to the murine Nurr1 gene, originally reported by Law et al. (1992) as a member of a nuclear receptor family that is highly expressed in brain and related to Nur77, an immediate-early response gene product. Animal model experiments lend further support to the function of NR4A2. Dopamine neurons of the substantia nigra and ventral tegmental area regulate movement and affective behavior and degenerate in Parkinson disease (OMIM Ref. No. 168600). Zetterstrom et al. (1997) showed that mouse Nurr1 is expressed in developing dopamine neurons before the appearance of known phenotypic markers for these cells. They also demonstrated that Nurr1 is an absolute requirement for development of midbrain dopamine neurons. Mice lacking the Nurr1 gene failed to

generate brain dopaminergic neurons, were hypoactive, and died soon after birth. Nurr1 expression continued into adulthood, and brains of heterozygous animals, otherwise apparently healthy, contained reduced dopamine levels. The authors suggested that putative Nurr1 ligands may be useful treatment of Parkinson disease and other disorders of midbrain dopamine circuitry.

[4303] It is appreciated that the abovementioned animal model for NR4A2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4304] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4305] Mages, H. W.; Rilke, O.; Bravo, R.; Senger, G.; Kroczeck, R. A. : NOT, a human immediate-early response gene closely related to the steroid/thyroid hormone receptor

NAK1/TR3. Molec. Endocr. 8: 1583–1591, 1994. ; and

[4306] Zetterstrom, R. H.; Solomin, L.; Jansson, L.; Hoffer, B. J.; Olson, L.; Perlmann, T. : Dopamine neuron agenesis in Nurr1-deficient mice. Science 276: 248–250, 1997.

[4307] Further studies establishing the function and utilities of NR4A2 are found in John Hopkins OMIM database record

ID 601828, and in cited publications numbered 1964–197 and 1111 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase C, Nu (PRKCN, Accession NM_005813) is another VGAM148 host target gene. PRKCN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:1252, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4308] Another function of VGAM148 is therefore inhibition of Protein Kinase C, Nu (PRKCN, Accession NM_005813). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693) is another VGAM148 host target gene. BIVM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIVM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIVM BINDING SITE, designated SEQ ID:1739, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4309] Another function of VGAM148 is therefore inhibition of Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIVM. DNA Cross-link Repair 1A (PSO2 homolog, *S. cerevisiae*) (DCLRE1A, Accession XM_044815) is another VGAM148 host target gene. DCLRE1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCLRE1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCLRE1A BINDING SITE, designated SEQ ID:2843, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4310] Another function of VGAM148 is therefore inhibition of DNA Cross-link Repair 1A (PSO2 homolog, *S. cerevisiae*)

(DCLRE1A, Accession XM_044815). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCLRE1A. Early B-cell Factor 2 (EBF2, Accession NM_022659) is another VGAM148 host target gene. EBF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EBF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EBF2 BINDING SITE, designated SEQ ID:1995, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4311] Another function of VGAM148 is therefore inhibition of Early B-cell Factor 2 (EBF2, Accession NM_022659). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EBF2. FLJ10852 (Accession NM_019028) is another VGAM148 host target gene. FLJ10852 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ10852 BINDING SITE, designated SEQ ID:1873, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4312] Another function of VGAM148 is therefore inhibition of FLJ10852 (Accession NM_019028). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10852. FLJ20220 (Accession NM_017718) is another VGAM148 host target gene. FLJ20220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20220 BINDING SITE, designated SEQ ID:1742, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4313] Another function of VGAM148 is therefore inhibition of FLJ20220 (Accession NM_017718). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20220. FLJ21952 (Accession NM_022494) is another VGAM148

host target gene. FLJ21952 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21952 BINDING SITE, designated SEQ ID:1992, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4314] Another function of VGAM148 is therefore inhibition of FLJ21952 (Accession NM_022494). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21952. MGC10724 (Accession NM_032720) is another VGAM148 host target gene. MGC10724 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10724 BINDING SITE, designated SEQ ID:2274, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4315] Another function of VGAM148 is therefore inhibition of MGC10724 (Accession NM_032720). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10724. MGC4238 (Accession NM_032332) is another VGAM148 host target gene. MGC4238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4238 BINDING SITE, designated SEQ ID:2247, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4316] Another function of VGAM148 is therefore inhibition of MGC4238 (Accession NM_032332). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4238. Rab11-FIP2 (Accession NM_014904) is another VGAM148 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:1581, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4317] Another function of VGAM148 is therefore inhibition of Rab11-FIP2 (Accession NM_014904). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. LOC90768 (Accession XM_033986) is another VGAM148 host target gene. LOC90768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90768 BINDING SITE, designated SEQ ID:2674, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:483.

[4318] Another function of VGAM148 is therefore inhibition of LOC90768 (Accession XM_033986). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90768. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 149 (VGAM149) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4319] VGAM149 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM149 was detected is described hereinabove with reference to Figs. 1–8.

[4320] VGAM149 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4321] VGAM149 gene encodes a VGAM149 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM149 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM149 precursor RNA is designated SEQ ID:135, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:135 is located at position 71497 relative to the genome of Vaccinia Virus.

[4322] VGAM149 precursor RNA folds onto itself, forming VGAM149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4323] An enzyme complex designated DICER COMPLEX, `dices` the VGAM149 folded precursor RNA into VGAM149 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM149 RNA is designated SEQ ID:484, and is provided hereinbelow with reference to the sequence listing part.

[4324] VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM149 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4325] VGAM149 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM149 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM149 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[4326] The complementary binding of VGAM149 RNA, herein designated VGAM RNA, to host target binding sites on VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM149 host target RNA into VGAM149 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4327] It is appreciated that VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM149 host target genes. The mRNA of each one of this plurality of VGAM149 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM149 RNA, herein designated VGAM RNA, and which when bound by VGAM149 RNA causes in-

hibition of translation of respective one or more VGAM149 host target proteins.

[4328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM149 gene, herein designated VGAM GENE, on one or more VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4329] It is yet further appreciated that a function of VGAM149 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM149 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM149 correlate with, and may be deduced from, the identity of the host target genes which VGAM149 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4330] Nucleotide sequences of the VGAM149 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM149 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM149 are further described hereinbelow with reference to Table 1.

[4331] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM149 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM149 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4332] As mentioned hereinabove with reference to Fig. 1, a function of VGAM149 gene, herein designated VGAM is inhibition of expression of VGAM149 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM149 correlate with, and may be deduced from, the identity of the target genes which VGAM149 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4333] Alanyl (membrane) Aminopeptidase (aminopeptidase N, aminopeptidase M, microsomal aminopeptidase, CD13, p150) (ANPEP, Accession NM_001150) is a VGAM149 host target gene. ANPEP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANPEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANPEP BINDING SITE, designated SEQ ID:805, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:484.

[4334] A function of VGAM149 is therefore inhibition of Alanyl (membrane) Aminopeptidase (aminopeptidase N, aminopeptidase M, microsomal aminopeptidase, CD13, p150) (ANPEP, Accession NM_001150), a gene which is a cell-surface transmembrane glycosylated metalloprotease that processes signaling peptides. Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ANPEP. The function of ANPEP has been established by previous studies. A surface antigen glycoprotein of molecular weight about 150,000 is recognized by monoclonal antibodies MY7 and MCS2. Look et al. (1986) isolated the complete ANPEP gene, which they called GP150, from a human placental genomic library. By study of somatic cell hybrid DNA and by in situ hybridization, the GP150 gene was assigned to 15q25–q26. This chromosomal location coincides with that of the oncogene FES (OMIM Ref. No. 190030), which is also expressed in myeloid cells. They are separate loci, however, because FES probes do not hybridize to cloned sequences spanning the GP150 gene and the 2 genes have different restriction maps. Like FES, GP150 is distal to the breakpoint in t(15;17)(q22;q21.1) of acute promyelocytic leukemia. By analysis of mouse–human somatic cell hybrids, Watt and Willard (1990) assigned the ANPEP gene, which they called PEPN, to 15q11–qter. With a genomic DNA probe, they detected a frequent DraIII polymorphism useful as a marker for human chromosome 15. Look et al. (1989) determined the complete primary structure of GP150, known as CD13. The large extracellular carboxyterminal domain contained

a pentapeptide consensus sequence characteristic of members of the zinc-binding metalloproteinase superfamily. Sequence comparisons with known enzymes of this class showed that CD13 and aminopeptidase N are identical. The latter enzyme was thought to be involved in the metabolism of regulatory peptides by diverse cell types, including small intestinal and renal tubular epithelial cells, macrophages, granulocytes, and synaptic membranes from the CNS.

[4335] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4336] Look, A. T.; Ashmun, R. A.; Shapiro, L. H.; Peiper, S. C. : Human myeloid plasma membrane glycoprotein CD13 (gp150) is identical to aminopeptidase N. J. Clin. Invest. 83: 1299–1307, 1989. ; and

[4337] Look, A. T.; Peiper, S. C.; Rebentisch, M. B.; Ashmun, R. A.; Roussel, M. F.; Lemons, R. S.; Le Beau, M. M.; Rubin, C. M.; Sherr, C. J. : Molecular cloning, expression, and chromosomal.

[4338] Further studies establishing the function and utilities of ANPEP are found in John Hopkins OMIM database record ID 151530, and in cited publications numbered

1156–1161 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nucleoside Phosphorylase (NP, Accession NM_000270) is another VGAM149 host target gene. NP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NP BINDING SITE, designated SEQ ID:724, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:484.

[4339] Another function of VGAM149 is therefore inhibition of Nucleoside Phosphorylase (NP, Accession NM_000270). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NP. Transcription Factor AP-2 Gamma (activating enhancer binding protein 2 gamma) (TFAP2C, Accession NM_003222) is another VGAM149 host target gene. TFAP2C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TFAP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TFAP2C BINDING SITE, designated SEQ ID:1000, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:484.

[4340] Another function of VGAM149 is therefore inhibition of Transcription Factor AP-2 Gamma (activating enhancer binding protein 2 gamma) (TFAP2C, Accession NM_003222), a gene which is a sequence-specific dna-binding protein that interacts with inducible viral and cellular enhancer elements to regulate transcription of selected genes. Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFAP2C. The function of TFAP2C has been established by previous studies. Families of related transcription factors are often expressed in the same cell lineages but at different times or sites in the developing embryo. The AP-2 family appears to regulate the expression of genes required for development of tissues of ectodermal origin such as neural crest and skin (Williamson et al., 1996). AP-2 may also be involved in the overexpression of c-erbB-2 (OMIM Ref. No. 164870) in human breast cancer cells (Bosher et al., 1995).

Williamson et al. (1996) isolated an AP-2-related cDNA. The predicted protein differs from AP-2-alpha (OMIM Ref. No. 107580) and -beta (OMIM Ref. No. 601601) in the N-terminal activation domain, but is 75 to 85% conserved within the DNA-binding and dimerization domains. All 3 gene products (AP-2-alpha, -beta, and -gamma) bind the GCCNNNGGC motif. Williamson et al. (1996) also obtained a genomic clone for AP-2-gamma (designated TFAP2C). They showed it to have a similar gene structure to TFAP2A and mapped it by fluorescence in situ hybridization to 20q13.2. A mouse genomic clone was used to map the mouse Tcfap2c locus to 2H3-4.

[4341] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4342] Bosher, J. M.; Williams, T.; Hurst, H. C. : The developmentally regulated transcription factor AP-2 is involved in c-erbB-2 overexpression in human mammary carcinoma. Proc. Nat. Acad. Sci. 92: 744-747, 1995. ; and

[4343] Williamson, J. A.; Bosher, J. M.; Skinner, A.; Sheer, D.; Williams, T.; Hurst, H. C. : Chromosomal mapping of the human and mouse homologues of two new members of the AP-2 family of tra.

[4344] Further studies establishing the function and utilities of TFAP2C are found in John Hopkins OMIM database record ID 601602, and in cited publications numbered 2094 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 83 (HPF1) (ZNF83, Accession NM_018300) is another VGAM149 host target gene. ZNF83 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF83, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF83 BINDING SITE, designated SEQ ID:1813, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:484.

[4345] Another function of VGAM149 is therefore inhibition of Zinc Finger Protein 83 (HPF1) (ZNF83, Accession NM_018300). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF83. MGC26766 (Accession NM_145021) is another VGAM149 host target gene. MGC26766 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by MGC26766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26766 BINDING SITE, designated SEQ ID:2509, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:484.

[4346] Another function of VGAM149 is therefore inhibition of MGC26766 (Accession NM_145021). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26766. SCYB10 (Accession NM_001565) is another VGAM149 host target gene. SCYB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYB10 BINDING SITE, designated SEQ ID:836, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:484.

[4347] Another function of VGAM149 is therefore inhibition of SCYB10 (Accession NM_001565). Accordingly, utilities of

VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYB10.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 150 (VGAM150) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4348] VGAM150 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM150 was detected is described hereinabove with reference to Figs. 1–8.

[4349] VGAM150 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4350] VGAM150 gene encodes a VGAM150 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM150 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM150 precursor RNA is designated SEQ

ID:136, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:136 is located at position 73985 relative to the genome of Vaccinia Virus.

[4351] VGAM150 precursor RNA folds onto itself, forming VGAM150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4352] An enzyme complex designated DICER COMPLEX, `dices` the VGAM150 folded precursor RNA into VGAM150 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of VGAM150 RNA is designated SEQ ID:485, and is provided hereinbelow with reference to the sequence list-

ing part.

[4353] VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM150 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM150 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4354] VGAM150 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM150 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM150 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM150 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM150 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4355] The complementary binding of VGAM150 RNA, herein designated VGAM RNA, to host target binding sites on VGAM150 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM150 host target RNA into VGAM150 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4356] It is appreciated that VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM150 host target genes. The mRNA of each one of this plurality of VGAM150 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM150 RNA, herein designated VGAM

RNA, and which when bound by VGAM150 RNA causes inhibition of translation of respective one or more VGAM150 host target proteins.

[4357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM150 gene, herein designated VGAM GENE, on one or more VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4358] It is yet further appreciated that a function of VGAM150 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM150 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM150 correlate with, and may be deduced from, the identity of the host target genes which VGAM150 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4359] Nucleotide sequences of the VGAM150 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM150 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM150 are further described hereinbelow with reference to Table 1.

[4360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM150 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM150 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4361] As mentioned hereinabove with reference to Fig. 1, a function of VGAM150 gene, herein designated VGAM is

inhibition of expression of VGAM150 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM150 correlate with, and may be deduced from, the identity of the target genes which VGAM150 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4362] Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302) is a VGAM150 host target gene. EBAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EBAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EBAF BINDING SITE, designated SEQ ID:2721, to the nucleotide sequence of VGAM150 RNA, herein designated VGAM RNA, also designated SEQ ID:485.

[4363] A function of VGAM150 is therefore inhibition of Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302), a gene which LEFT-RIGHT AXIS MALFORMATIONS. Accordingly, utilities of VGAM150

include diagnosis, prevention and treatment of diseases and clinical conditions associated with EBAF. The function of EBAF has been established by previous studies. Because of the possibility that Lefty mutations may be associated with human L–R axis malformations, Kosaki et al. (1999) characterized 2 human homologs, LEFTY A and LEFTY B (OMIM Ref. No. 603037). PCR screening of a PAC genomic library identified a clone that contained both LEFTY A and LEFTY B genes. Restriction mapping showed that the genes are separated by approximately 50 kb and are oriented in tandem. The 2 genes were localized by FISH to 1q42, a region syntenic to the location to which the mouse Lefty genes have been mapped at 1H5 (Meno et al., 1997). Both LEFTY A and LEFTY B contain 4 exons which are spliced at identical positions, and both genes encode proteins with 366 amino acids. LEFTY A was found to be identical to EBAF, the cDNA previously identified by Kothapalli et al. (1997). The deduced amino acid sequences of LEFTY A and LEFTY B are more similar to each other than to Lefty–1 or Lefty–2 of the mouse. Analysis of 126 human cases of L–R axis malformation showed 1 nonsense and 1 missense mutation in the LEFTY A gene. Both mutations lay in the cysteine–knot region of the

LEFTY A protein, and the phenotype of affected individuals was very similar to that typically seen in Lefty-1 $-/-$ mice with L-R axis malformations. Because of the possibility that Lefty mutations may be associated with human L-R axis malformations, Kosaki et al. (1999) characterized 2 human homologs, LEFTY A and LEFTY B (OMIM Ref. No. 603037). PCR screening of a PAC genomic library identified a clone that contained both LEFTY A and LEFTY B genes. Restriction mapping showed that the genes are separated by approximately 50 kb and are oriented in tandem. The 2 genes were localized by FISH to 1q42, a region syntenic to the location to which the mouse Lefty genes have been mapped at 1H5 (Meno et al., 1997). Both LEFTY A and LEFTY B contain 4 exons which are spliced at identical positions, and both genes encode proteins with 366 amino acids. LEFTY A was found to be identical to EBAF, the cDNA previously identified by Kothapalli et al. (1997). The deduced amino acid sequences of LEFTY A and LEFTY B are more similar to each other than to Lefty-1 or Lefty-2 of the mouse. Analysis of 126 human cases of L-R axis malformation showed 1 nonsense and 1 missense mutation in the LEFTY A gene. Both mutations lay in the cysteine-knot region of the LEFTY A protein, and the

phenotype of affected individuals was very similar to that typically seen in Lefty-1 $-/-$ mice with L-R axis malformations. Animal model experiments lend further support to the function of EBAF. Lefty-1, lefty-2, and nodal (OMIM Ref. No. 601265) are expressed on the left side of developing mouse embryos and are implicated in L-R determination. Meno et al. (1998) examined the role of lefty-1 by analyzing mutant mice lacking this gene. The lefty-1-deficient mice showed a variety of L-R positional defects in visceral organs. The most common feature of lefty-1 $-/-$ mice was thoracic left isomerism (rather than right isomerism). The lack of lefty-1 resulted in bilateral expression of nodal, lefty-2, and Pitx2 (OMIM Ref. No. 601542), a homeo box gene normally expressed on the left side. These observations suggested that the role of lefty-1 is to restrict the expression of lefty-2 and nodal to the left side, and that lefty-2 or nodal encode a signal for 'leftness.'

[4364] It is appreciated that the abovementioned animal model for EBAF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4365] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [4366] Kosaki, K.; Bassi, M. T.; Kosaki, R.; Lewin, M.; Belmont, J.; Schauer, G.; Casey, B. : Characterization and mutation analysis of human LEFTY A and LEFTY B, homologues of murine genes implicated in left–right axis development. Am. J. Hum. Genet. 64: 712–721, 1999. ; and
- [4367] Meno, C.; Shimonio, A.; Saijoh, Y.; Yashiro, K.; Mochida, K.; Ohishi, S.; Noji, S.; Kondoh, H.; Hamada, H. : Lefty–1 is required for left–right determination as a regulator of lefty–2 an.
- [4368] Further studies establishing the function and utilities of EBAF are found in John Hopkins OMIM database record ID 601877, and in cited publications numbered 2738–325 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_000131) is another VGAM150 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:706 and SEQ ID:1885 respectively, to the nucleotide sequence of VGAM150 RNA, herein designated VGAM RNA, also designated SEQ ID:485.

[4369] Another function of VGAM150 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_000131). Accordingly, utilities of VGAM150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. LOC146438 (Accession XM_085464) is another VGAM150 host target gene. LOC146438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146438 BINDING SITE, designated SEQ ID:3091, to the nucleotide sequence of VGAM150 RNA, herein designated VGAM RNA, also designated SEQ ID:485.

[4370] Another function of VGAM150 is therefore inhibition of LOC146438 (Accession XM_085464). Accordingly, utilities of VGAM150 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC146438. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 151 (VGAM151) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4371] VGAM151 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM151 was detected is described hereinabove with reference to Figs. 1–8.

[4372] VGAM151 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM151 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4373] VGAM151 gene encodes a VGAM151 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM151 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM151 precursor RNA is designated SEQ

ID:137, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:137 is located at position 72599 relative to the genome of Vaccinia Virus.

[4374] VGAM151 precursor RNA folds onto itself, forming VGAM151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4375] An enzyme complex designated DICER COMPLEX, `dices` the VGAM151 folded precursor RNA into VGAM151 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM151 RNA is designated SEQ ID:486, and is provided hereinbelow with reference to the sequence list-

ing part.

[4376] VGAM151 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM151 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4377] VGAM151 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM151 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM151 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4378] The complementary binding of VGAM151 RNA, herein designated VGAM RNA, to host target binding sites on VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM151 host target RNA into VGAM151 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4379] It is appreciated that VGAM151 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM151 host target genes. The mRNA of each one of this plurality of VGAM151 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM151 RNA, herein designated VGAM

RNA, and which when bound by VGAM151 RNA causes inhibition of translation of respective one or more VGAM151 host target proteins.

[4380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM151 gene, herein designated VGAM GENE, on one or more VGAM151 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4381] It is yet further appreciated that a function of VGAM151 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM151 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM151 correlate with, and may be deduced from, the identity of the host target genes which VGAM151 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4382] Nucleotide sequences of the VGAM151 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM151 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM151 are further described hereinbelow with reference to Table 1.

[4383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM151 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM151 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4384] As mentioned hereinabove with reference to Fig. 1, a function of VGAM151 gene, herein designated VGAM is

inhibition of expression of VGAM151 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM151 correlate with, and may be deduced from, the identity of the target genes which VGAM151 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4385] 2,3-bisphosphoglycerate Mutase (BPGM, Accession NM_001724) is a VGAM151 host target gene. BPGM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BPGM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPGM BINDING SITE, designated SEQ ID:852, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4386] A function of VGAM151 is therefore inhibition of 2,3-bisphosphoglycerate Mutase (BPGM, Accession NM_001724), a gene which plays a role in regulating hemoglobin oxygen affinity. Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPGM. The function of BPGM has been established by previous

studies. Chen et al. (1971) described a genetically determined electrophoretic variant of 2,3-diphosphoglycerate mutase in a Canadian Eskimo family. The findings in heterozygotes were consistent with the view that the protein is a dimer of 2 identical subunits. Scott and Wright (1982) found DPGM to be polymorphic in 4 Alaskan ethnic groups. Hemoglobin and hematocrit were elevated in all deficient persons. Thus, both hemolytic anemia and polycythemia have been observed with deficiency of DPGM. Rosa et al. (1973, 1978) showed that the DPGM and 2,3-bisphosphoglycerate phosphatase activities of red cells are due to a single enzyme, bisphosphoglycerate mutase (EC 5.4.2.4). Joulin et al. (1986) cloned and sequenced cDNA for human red cell 2,3-bisphosphoglycerate mutase (EC 2.7.5.4). They presented a revised amino acid sequence of human BPGM based on the nucleotide sequence data. BPGM shows some phosphoglycerate mutase activity (Sasaki et al., 1975); nevertheless, the major portion of PGAM activity in the red cells is expressed by PGAMA (OMIM Ref. No. 172250), a protein genetically distinct from BPGM but structurally related to it. The PGAMA locus is situated on chromosome 10. Using a cDNA clone for human BPGM in

in situ hybridization experiments, Joulin et al. (1987) and Barichard et al. (1987) mapped the BPGM gene to 7q22–q34. Joulin et al. (1988) isolated the 2,3–bisphosphoglycerate mutase gene from genomic libraries. By Southern blots and DNA sequencing, they determined that it extends over 22 kb and is composed of 2 introns and 3 exons. The second exon correlates with a functional subdomain of the protein. No GC–rich sequence or GC box was found in the 5–prime flanking region of the gene. Both amino acid and cDNA sequence studies show that DPGAM is homologous to PGAM (172250, 261670) (Joulin et al., 1986; Yanagawa et al., 1986).

[4387] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4388] Rosa, R.; Prehu, M.–O.; Beuzard, Y.; Rosa, J. : The first case of a complete deficiency of diphosphoglycerate mutase in human erythrocytes. J. Clin. Invest. 62: 907–915, 1978. ; and

[4389] Joulin, V.; Peduzzi, J.; Romeo, P.–H.; Rosa, R.; Valentin, C.; Dubart, A.; Lapeyre, B.; Blouquit, Y.; Garel, M.–C.; Goossens, M.; Rosa, J.; Cohen–Solal, M. : Molecular

cloning and sequen.

[4390] Further studies establishing the function and utilities of BPGM are found in John Hopkins OMIM database record ID 222800, and in cited publications numbered 2250–2252, 401, 2253–2258, 14, 2259–2261, 88 and 2262–2265 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hyaluronan Synthase 2 (HAS2, Accession NM_005328) is another VGAM151 host target gene. HAS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAS2 BINDING SITE, designated SEQ ID:1198, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4391] Another function of VGAM151 is therefore inhibition of Hyaluronan Synthase 2 (HAS2, Accession NM_005328), a gene which plays a role in hyaluronan/hyaluronic acid (ha) synthesis and transport . Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAS2. The

function of HAS2 has been established by previous studies. Hyaluronan, or hyaluronic acid (HA), is a high molecular weight unbranched polysaccharide of the extracellular matrix. Watanabe and Yamaguchi (1996) described the cloning of a human cDNA from a fibroblast library using degenerate PCR with primers based on regions of conservation between the previously published *Xenopus* DG42 and *Streptococcus* HasA proteins. When expressed in cell culture, the cDNA increased hyaluronan production. The sequence of the predicted 552-amino acid protein differs from HAS1 (OMIM Ref. No. 601463) and so was designated HAS2. The HAS2 amino acid sequence is 55% similar to the *Xenopus* DG42 sequence and 55% identical to mouse Has1. Northern blots showed high levels of HAS2 mRNA in a proliferating human fibroblast cell line but not in growth-arrested cells. Watanabe and Yamaguchi (1996) speculated that if HAS2 is not a true hyaluronan synthase, it is at least a major inducer of HA synthase activity. Spicer et al. (1996) isolated the apparent mouse homolog of human HAS2 from a mouse embryo cDNA library using degenerate PCR. The predicted mouse protein is also 552 amino acids long. The Has2 protein is predicted to contain multiple transmembrane domains similar to bacterial

HasA and mammalian HAS1. Northern blots demonstrated 4.8- and 3.2-kb transcripts expressed highly in the mouse embryo and at lower levels in adult heart, brain, spleen, lung, and skeletal muscle. When expressed in COS cells, the cDNA was shown to induce the formation of large HA coats around the cells. Based on analogy with what is known about HA production in *Streptococcus*, Spicer et al. (1996) suggested that HAS2 may play a key role in HA transport rather than act as a synthase per se.

[4392] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4393] Watanabe, K.; Yamaguchi, Y. : Molecular identification of a putative human hyaluronan synthase. *J. Biol. Chem.* 271: 22945–22948, 1996. ; and

[4394] Spicer, A. P.; Augustine, M. L.; McDonald, J. A. : Molecular cloning and characterization of a putative mouse hyaluronan synthase. *J. Biol. Chem.* 271: 23400–23406, 1996.

[4395] Further studies establishing the function and utilities of HAS2 are found in John Hopkins OMIM database record ID 601636, and in cited publications numbered 1551–630 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Histone Deacetylase

2 (HDAC2, Accession XM_165684) is another VGAM151 host target gene. HDAC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC2 BINDING SITE, designated SEQ ID:3507, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4396] Another function of VGAM151 is therefore inhibition of Histone Deacetylase 2 (HDAC2, Accession XM_165684), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and mediates transcriptional repression. Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC2. The function of HDAC2 has been established by previous studies. Zhang et al. (1998) identified the SIN3-associated 30-kD protein SAP30 (OMIM Ref. No. 603378) as a novel component of the human histone deacetylase complex which is conserved among eukaryotic organisms. This complex includes SIN3, SAP18 (OMIM Ref. No. 602949),

the histone deacetylases HDAC1 (OMIM Ref. No. 601241) and HDAC2, the histone-binding proteins RbAp46 (RBBP7; 602922) and RbAp48 (RBBP4; 602923), as well as other polypeptides. Yarden and Brody (1999) reported that BRCA1 (OMIM Ref. No. 113705) interacts in vivo and in vitro with RBBP7 and RBBP4, with RB1 (OMIM Ref. No. 180200), and that the BRCT domain of BRCA1 associates with HDAC1 and HDAC2. Rountree et al. (2000) showed that DNMT1 (OMIM Ref. No. 126375) can establish a repressive transcription complex consisting of DNMT1, HDAC2, and DMAP1 (OMIM Ref. No. 605077). The noncatalytic amino terminus of DNMT1 binds to HDAC2 and to DMAP1 and can mediate transcriptional repression. DMAP1 is targeted to replication foci through interaction with the far N terminus of DNMT1 throughout S phase, whereas HDAC2 joins DNMT1 and DMAP1 only during late S phase, providing a platform for how histones may become deacetylated in heterochromatin following replication.

[4397] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4398] Yarden, R. I.; Brody, L. C. : BRCA1 interacts with compo-

nents of the histone deacetylase complex. Proc. Nat. Acad. Sci. 96: 4983–4988, 1999. ; and

[4399] Rountree, M. R.; Bachman, K. E.; Baylin, S. B. : DNMT1 binds HDAC2 and a new co-repressor, DMAP1, to form a complex at replication foci. Nature Genet. 25: 269–277, 2000.

[4400] Further studies establishing the function and utilities of HDAC2 are found in John Hopkins OMIM database record ID 605164, and in cited publications numbered 971–973, 793, 974–97 and 1697 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM_005431) is another VGAM151 host target gene. XRCC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XRCC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC2 BINDING SITE, designated SEQ ID:1208, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4401] Another function of VGAM151 is therefore inhibition of X–

ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM_005431), a gene which involves in the homologous recombination repair (hrr) pathway of double-stranded dna. Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC2. The function of XRCC2 has been established by previous studies. Johnson et al. (1999) demonstrated that XRCC2 is essential for the efficient repair of DNA double-strand breaks by homologous recombination between sister chromatids. Hamster cells deficient in XRCC2 showed a more than 100-fold decrease in homologous recombination induced by double-strand breaks compared with the parental cell line. This defect was corrected to almost wildtype levels by transient transfection with a plasmid expressing XRCC2. The repair defect in XRCC2 mutant cells appeared to be restricted to recombinational repair because nonhomologous end joining was normal. Johnson et al. (1999) concluded that XRCC2 is involved in the repair of DNA double-strand breaks by homologous recombination. Using a yeast 2-hybrid assay, Braybrooke et al. (2000) identified a direct interaction between XRCC2 and RAD51L3 (OMIM Ref. No. 602954), and they confirmed the

interaction by pull-down assays between recombinant XRCC2 and endogenous RAD51L3 in HeLa cell extracts. Size-exclusion chromatography followed by Western blot analysis suggested that the 2 proteins exist as a heterodimer of about 70 kD.

[4402] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4403] Johnson, R. D.; Liu, N.; Jasin, M. : Mammalian XRCC2 promotes the repair of DNA double-strand breaks by homologous recombination. *Nature* 401: 397-399, 1999. ; and

[4404] Braybrooke, J. P.; Spink, K. G.; Thacker, J.; Hickson, I. D. : The RAD51 family member, RAD51L3, is a DNA-stimulated ATPase that forms a complex with XRCC2. *J. Biol. Chem.* 275: 29100-29.

[4405] Further studies establishing the function and utilities of XRCC2 are found in John Hopkins OMIM database record ID 600375, and in cited publications numbered 337-345 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. APACD (Accession NM_005783) is another VGAM151 host target gene.

APACD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

APACD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APACD BINDING SITE, designated SEQ ID:1249, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4406] Another function of VGAM151 is therefore inhibition of APACD (Accession NM_005783). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APACD. SCIN (Accession NM_033128) is another VGAM151 host target gene. SCIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCIN BINDING SITE, designated SEQ ID:2313, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4407] Another function of VGAM151 is therefore inhibition of SCIN (Accession NM_033128). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SCIN.

Ubiquitin Specific Protease 16 (USP16, Accession NM_006447) is another VGAM151 host target gene. USP16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP16 BINDING SITE, designated SEQ ID:1303, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4408] Another function of VGAM151 is therefore inhibition of Ubiquitin Specific Protease 16 (USP16, Accession NM_006447). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP16. LOC115004 (Accession XM_055002) is another VGAM151 host target gene. LOC115004 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115004 BINDING SITE, desig-

nated SEQ ID:2970, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4409] Another function of VGAM151 is therefore inhibition of LOC115004 (Accession XM_055002). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115004. LOC146520 (Accession XM_085492) is another VGAM151 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:3096, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4410] Another function of VGAM151 is therefore inhibition of LOC146520 (Accession XM_085492). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC219333 (Accession XM_167944) is another VGAM151 host target gene. LOC219333 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219333 BINDING SITE, designated SEQ ID:3607, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:486.

[4411] Another function of VGAM151 is therefore inhibition of LOC219333 (Accession XM_167944). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 152 (VGAM152) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4412] VGAM152 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM152 was detected is described hereinabove with reference to Figs. 1-8.

[4413] VGAM152 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4414] VGAM152 gene encodes a VGAM152 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM152 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM152 precursor RNA is designated SEQ ID:138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:138 is located at position 74425 relative to the genome of Vaccinia Virus.

[4415] VGAM152 precursor RNA folds onto itself, forming VGAM152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[4416] An enzyme complex designated DICER COMPLEX, `dices` the VGAM152 folded precursor RNA into VGAM152 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM152 RNA is designated SEQ ID:487, and is provided hereinbelow with reference to the sequence listing part.

[4417] VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM152 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM152 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4418] VGAM152 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM152 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM152 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM152 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM152 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[4419] The complementary binding of VGAM152 RNA, herein designated VGAM RNA, to host target binding sites on VGAM152 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM152 host target RNA into VGAM152 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4420] It is appreciated that VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM152 host target genes. The mRNA of each one of this plurality of VGAM152 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM152 RNA, herein designated VGAM RNA, and which when bound by VGAM152 RNA causes inhibition of translation of respective one or more VGAM152 host target proteins.

[4421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM152 gene, herein designated VGAM GENE, on one or more VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4422] It is yet further appreciated that a function of VGAM152 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM152 correlate with, and may be deduced from, the identity of the host target genes which VGAM152 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4423] Nucleotide sequences of the VGAM152 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM152 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM152 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM152 are further described hereinbelow with reference to Table 1.

[4424] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM152 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM152 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4425] As mentioned hereinabove with reference to Fig. 1, a function of VGAM152 gene, herein designated VGAM is inhibition of expression of VGAM152 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM152 correlate with, and may be deduced from, the identity of the target genes which VGAM152 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4426] Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147) is a VGAM152 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:3442, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:487.

[4427] A function of VGAM152 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A has been established by previous studies. The small eukaryotic initiation factor eIF4C is implicated in the translation initiation pathway, where it enhances ribosome dissociation into subunits and stabilizes the binding of the initiator Met-tRNA to 40S ribosomal subunits. Dever et al. (1994) purified rabbit eIF4C and determined its amino acid sequence. By PCR with degenerate primers based on the rabbit eIF4C sequence, they isolated a partial human leukemia cDNA encoding eIF4C. They screened a leukemia cDNA library with the partial cDNA and obtained additional clones corresponding to the entire human eIF4C coding region. The sequence of the predicted 144-amino acid human protein was identical to

that of rabbit eIF4C except in a single position. The human protein had an unblocked N-terminal proline, which Dever et al. (1994) stated was consistent with the general pattern of eukaryotic protein processing that removes an initiating methionine when it is followed by a proline. Sequence analysis revealed that eIF4C has a polar structure, with 9 of the first 15 amino acids being basic and 13 of the last 20 amino acids being acidic. The authors suggested that the dipole nature of the protein may allow it to interact with 2 different types of surfaces, perhaps functioning as a bridge between 2 initiation factors or between an initiation factor and the ribosome. Lahn and Page (1997) mapped the EIF1A gene to the X chromosome by analysis of a somatic cell hybrid panel. They designated this gene EIF1AX to distinguish it from the Y-linked homolog, EIF1AY (OMIM Ref. No. 400014). Lahn and Page (1997) determined that the EIF1AX gene escapes X inactivation, and proposed that it should be investigated as a candidate gene for Turner syndrome. See 400010.

[4428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4431] Further studies establishing the function and utilities of EIF1A are found in John Hopkins OMIM database record ID 300186, and in cited publications numbered 178 and 2526 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Enamelin (ENAM, Accession NM_031889) is another VGAM152 host target gene. ENAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAM BINDING SITE, designated SEQ ID:2217, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:487.

[4432] Another function of VGAM152 is therefore inhibition of Enamelin (ENAM, Accession NM_031889). Accordingly,

utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAM. V-myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (MYCL1, Accession NM_005376) is another VGAM152 host target gene. MYCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL1 BINDING SITE, designated SEQ ID:1204, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:487.

[4433] Another function of VGAM152 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (MYCL1, Accession NM_005376), a gene which is a Myc-like transcription factor. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL1. The function of MYCL1 has been established by previous studies. Nau et al. (1985) cloned from DNA of small-cell lung cancer (SCCL) a gene

with homology to a small region of both MYC (OMIM Ref. No. 190080) and NMYC (OMIM Ref. No. 164840). By somatic cell hybridization and in situ hybridization, they assigned the gene to 1p32. This LMYC sequence was amplified 10- to 20-fold in the DNA of 4 SCCL lines and of 1 SCCL specimen taken directly from a patient. A restriction polymorphism was found. In heterozygotes, only 1 of the 2 alleles was amplified in any 1 genome. In a linkage map of chromosome 1 prepared by Rouleau et al. (1990), it was concluded that MYCL1 is 17 cM proximal to RH. Kaye et al. (1988) found that the LMYC gene is composed of 3 exons and 2 introns spanning 6.6 kilobases. Several distinct mRNAs were produced in all SCCL cell lines that expressed LMYC. These transcripts were generated from a single gene by alternative splicing of introns 1 and 2 and by use of alternative polyadenylation signals. Comparisons with MYC and NMYC demonstrated multiple discrete regions with extensive homology. Kawashima et al. (1988) concluded that a correlation exists between particular RFLP alleles of the MYCL gene and the occurrence of metastasis of lung cancer to lymph nodes and other organs. Among lung cancer patients, those with only the L band (10 kb) had few lymph node metastases, whereas

patients with either the S band (6 kb) or the S and L bands almost always had lymph node metastases. A similar correlation was found between the presence of the S band and metastases to other organs. The correlation was particularly marked in cases of adenocarcinoma of the lung. By study of DNA from mouse–hamster somatic cell hybrids, Campbell et al. (1989) mapped 2 L–myc loci provisionally to mouse chromosomes 4 and 12. The locus on chromosome 12 may be a pseudogene. When studying chromosome 1p breakpoints in neuroblastoma cell lines using fluorescence in situ hybridization (FISH) with region–specific probes, Van Roy et al. (1995) found evidence for a position of MYCL1 more distal than 1p32. To investigate the discrepancy Speleman et al. (1996) used FISH on high–resolution R–banded chromosomes with a YAC clone for MYCL1 and reassigned the gene to 1p34.3.

[4434] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4435] Kawashima, K.; Shikama, H.; Imoto, K.; Izawa, M.; Naruke, T.; Okabayashi, K.; Nishimura, S. : Close correlation between restriction fragment length polymorphism of the L–MYC gene and metastasis of human lung cancer to the

lymph nodes and other organs. Proc. Nat. Acad. Sci. 85: 2353–2356, 1988. ; and

[4437] Further studies establishing the function and utilities of MYCL1 are found in John Hopkins OMIM database record ID 164850, and in cited publications numbered 36 and 392–398 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422) is another VGAM152 host target gene. ZNF42 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF42 BINDING SITE, designated SEQ ID:1018, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:487.

[4438] Another function of VGAM152 is therefore inhibition of

Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422), a gene which may be one regulator of transcriptional events during hemopoietic development. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF42. The function of ZNF42 has been established by previous studies. Zinc finger genes encode metal-binding proteins that can act as transcriptional regulators of other genes. In an effort to identify activators of the genetic cascade in hemopoietic differentiation, Hromas et al. (1991) used degenerate synthetic oligonucleotides to the conserved zinc finger histidine-cysteine link to probe a human myeloid lambda gt11 cDNA library. One of the cDNA clones obtained hybridized preferentially to mRNA from myeloid cells. Sequence analysis of the coding region for the gene demonstrated 13 zinc finger regions and a glycine-proline-rich region between the fourth and fifth zinc finger domains. The gene was localized to 19q13.2-q13.4 by chromosomal in situ hybridization, confirmed by hybridization of a labeled probe to dot blots of flow-sorted chromosomes. Chromosome 19 contains other zinc finger genes, e.g., ZFP36 (OMIM Ref. No. 190700), which is lo-

cated at 19q13.1. The new zinc finger gene, which they designated MZF-1 for 'myeloid zinc finger,' was preferentially expressed in myeloid leukemia cell lines, with the highest mRNA levels noted in cells induced to differentiate with retinoic acid. The ZNF42 gene may be a regulator of transcriptional events during hemopoietic development. The myeloid zinc finger gene 1 (MZF1) is a putative transcription factor of the C2H2 zinc finger gene family. Morris et al. (1995) found that MZF1 regulates the CD34 promoter (OMIM Ref. No. 142230) in a tissue-specific manner. They had previously demonstrated MZF-1 binding sites in the promoters of several genes expressed during myeloid differentiation.

[4439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4440] Hromas, R.; Collins, S. J.; Hickstein, D.; Raskind, W.; Deaven, L. L.; O'Hara, P.; Hagen, F. S.; Kaushansky, K. : A retinoic acid-responsive human zinc finger gene, MZF-1, preferentially expressed in myeloid cells. J. Biol. Chem. 266: 14183-14187, 1991. ; and

[4441] Morris, J. F.; Rauscher, F. J., III; Davis, B.; Klemsz, M.; Xu, D.; Tenen, D.; Hromas, R. : The myeloid zinc finger gene,

MZF-1, regulates the CD34 promoter in vitro. Blood 86: 3640-3647.

[4442] Further studies establishing the function and utilities of ZNF42 are found in John Hopkins OMIM database record ID 194550, and in cited publications numbered 105-106 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ23604 (Accession NM_025064) is another VGAM152 host target gene. FLJ23604 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23604 BINDING SITE, designated SEQ ID:2134, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:487.

[4443] Another function of VGAM152 is therefore inhibition of FLJ23604 (Accession NM_025064). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23604. Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259) is another VGAM152 host target

gene. HEY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEY2 BINDING SITE, designated SEQ ID:1419, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:487.

[4444] Another function of VGAM152 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEY2. TSC22 (Accession NM_006022) is another VGAM152 host target gene. TSC22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSC22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSC22 BINDING SITE, designated SEQ ID:1265, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:487.

[4445] Another function of VGAM152 is therefore inhibition of TSC22 (Accession NM_006022). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSC22. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 153 (VGAM153) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4446] VGAM153 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM153 was detected is described hereinabove with reference to Figs. 1–8.

[4447] VGAM153 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4448] VGAM153 gene encodes a VGAM153 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM153 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM153 precursor RNA is designated SEQ ID:139, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:139 is located at position 74889 relative to the genome of Vaccinia Virus.

[4449] VGAM153 precursor RNA folds onto itself, forming VGAM153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4450] An enzyme complex designated DICER COMPLEX, `dices` the VGAM153 folded precursor RNA into VGAM153 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide se-

quence of VGAM153 RNA is designated SEQ ID:488, and is provided hereinbelow with reference to the sequence listing part.

[4451] VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM153 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[4452] VGAM153 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM153 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM153 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[4453] The complementary binding of VGAM153 RNA, herein designated VGAM RNA, to host target binding sites on VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM153 host target RNA into VGAM153 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4454] It is appreciated that VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM153 host target genes. The mRNA of each one of this plurality of VGAM153 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM153 RNA, herein designated VGAM RNA, and which when bound by VGAM153 RNA causes inhibition of translation of respective one or more VGAM153 host target proteins.

[4455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM153 gene, herein designated VGAM GENE, on one or more VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4456] It is yet further appreciated that a function of VGAM153 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM153 correlate with, and may be deduced from, the identity of the host target genes which VGAM153 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4457] Nucleotide sequences of the VGAM153 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM153 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM153 are further described hereinbelow with reference to Table 1.

[4458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM153 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM153 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4459] As mentioned hereinabove with reference to Fig. 1, a function of VGAM153 gene, herein designated VGAM is inhibition of expression of VGAM153 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM153 correlate with, and may be deduced from, the identity of the target genes which VGAM153 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4460] FLJ20296 (Accession NM_017750) is a VGAM153 host target gene. FLJ20296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20296 BINDING SITE, designated SEQ ID:1748, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:488.

[4461] A function of VGAM153 is therefore inhibition of FLJ20296 (Accession NM_017750). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20296. RAB22A, Member RAS Oncogene Family (RAB22A, Acces-

sion XM_009454) is another VGAM153 host target gene. RAB22A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB22A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB22A BINDING SITE, designated SEQ ID:2546, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:488.

[4462] Another function of VGAM153 is therefore inhibition of RAB22A, Member RAS Oncogene Family (RAB22A, Accession XM_009454). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB22A. UPLC1 (Accession NM_017707) is another VGAM153 host target gene. UPLC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UPLC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UPLC1 BINDING SITE, designated SEQ ID:1740, to the nucleotide sequence of VGAM153 RNA,

herein designated VGAM RNA, also designated SEQ ID:488.

[4463] Another function of VGAM153 is therefore inhibition of UPLC1 (Accession NM_017707). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPLC1. LOC122886 (Accession XM_063344) is another VGAM153 host target gene. LOC122886 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122886, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122886 BINDING SITE, designated SEQ ID:3028, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:488.

[4464] Another function of VGAM153 is therefore inhibition of LOC122886 (Accession XM_063344). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122886. LOC222194 (Accession XM_168443) is another VGAM153 host target gene. LOC222194 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC222194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222194 BINDING SITE, designated SEQ ID:3637, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:488.

[4465] Another function of VGAM153 is therefore inhibition of LOC222194 (Accession XM_168443). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222194. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 154 (VGAM154) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4466] VGAM154 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM154 was detected is described hereinabove with reference to Figs. 1-8.

[4467] VGAM154 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4468] VGAM154 gene encodes a VGAM154 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM154 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM154 precursor RNA is designated SEQ ID:140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:140 is located at position 80970 relative to the genome of Vaccinia Virus.

[4469] VGAM154 precursor RNA folds onto itself, forming VGAM154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4470] An enzyme complex designated DICER COMPLEX, `dices` the VGAM154 folded precursor RNA into VGAM154 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM154 RNA is designated SEQ ID:489, and is provided hereinbelow with reference to the sequence listing part.

[4471] VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM154 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4472] VGAM154 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM154 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM154 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4473] The complementary binding of VGAM154 RNA, herein designated VGAM RNA, to host target binding sites on VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM154 host tar-

get RNA into VGAM154 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4474] It is appreciated that VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM154 host target genes. The mRNA of each one of this plurality of VGAM154 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM154 RNA, herein designated VGAM RNA, and which when bound by VGAM154 RNA causes inhibition of translation of respective one or more VGAM154 host target proteins.

[4475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM154 gene, herein designated VGAM GENE, on one or more VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4476] It is yet further appreciated that a function of VGAM154 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM154 correlate with, and may be deduced from, the identity of the host target genes which VGAM154 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4477] Nucleotide sequences of the VGAM154 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM154 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM154 are further

described hereinbelow with reference to Table 1.

[4478] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM154 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM154 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4479] As mentioned hereinabove with reference to Fig. 1, a function of VGAM154 gene, herein designated VGAM is inhibition of expression of VGAM154 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM154 correlate with, and may be deduced from, the identity of the target genes which VGAM154 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4480] Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_002211) is a VGAM154 host target gene. ITGB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ITGB1 BINDING SITE, designated SEQ ID:909, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4481] A function of VGAM154 is therefore inhibition of Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_002211), a gene which acts as a fibronectin receptor. Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB1. The function of ITGB1 has been established by previous studies. See 135620. The fibronectin receptors contain a beta subunit that appears to be analogous to band 3 of integrin (Pytela et al., 1986; Johansson et al., 1987). Hynes (1987) proposed that there are 3 subfamilies within the family of human adhesion protein receptor heterodimers based upon the number of different beta subunits. The other 2 subfamilies are the platelet and the endothelial cell heterodimers, which use GP IIIa (OMIM Ref. No. 173470), and the leukocyte heterodimers, which contain a 95,000 Da beta subunit that is homologous to GP IIIa but is clearly a different protein (OMIM Ref. No. 116920). Zhang et al. (1988) examined

human–mouse hybrid cells by indirect immunofluorescence with a monoclonal antibody that recognizes the beta subunit of the human fibronectin receptor. Cells that expressed the antigen at their surface were sorted by FACS and karyotyped. The findings, strengthened by isozyme analysis of markers for chromosomes 9 and 10, suggested that the beta subunit is located on 10p. By examining the cation dependence of JAM2 (OMIM Ref. No. 606870) adhesion to a T-cell line, Cunningham et al. (2002) identified a manganese-enhanced binding component indicative of integrin involvement. Using neutralizing integrin antibodies, they showed that the manganese-enhanced binding component was due to an interaction between JAM2 and ITGA4/ITGB1. However, the interaction was only enabled following prior adhesion of JAM2 to JAM3 (OMIM Ref. No. 606871). Cunningham et al. (2002) determined that the engagement of all these ligands occurs through a nonacidic residue in an Ig-like fold of JAM2. An inhibitor of ITGA4, TBC772, attenuated the manganese-enhanced binding. Animal model experiments lend further support to the function of ITGB1. Graus-Porta et al. (2001) used Cre/Lox-mediated recombination to generate mice with an *Itgb1*–null allele in the precursors

of neurons and glia, thereby inactivating all beta-1-class integrin receptors in the nervous system. The mice died prematurely after birth with severe brain malformations. Using histologic sections of brains at varying ages, Graus-Porta et al. (2001) observed that cortical hemispheres and cerebellar folia fuse, and cortical laminae are perturbed in the knockout mice. These defects result from disorganization of the cortical marginal zone, where Graus-Porta et al. (2001) hypothesized that beta-1-class integrins regulate glial endfeet anchorage, meningeal basement membrane remodeling, and formation of the Cajal-Retzius cell layer. Graus-Porta et al. (2001) concluded that beta-1-class integrins are not essential for neuron-glia interactions and neuronal migration during corticogenesis. They noted that the phenotype of the beta-1-deficient mice resembles pathologic changes observed in human cortical dysplasias, suggesting that defective integrin-mediated signal transduction contributes to the development of some of these diseases

[4482] It is appreciated that the abovementioned animal model for ITGB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

- [4483] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [4484] Zhang, Y.; Saison, M.; Spaepen, M.; De Strooper, B.; Van Leuven, F.; David, G.; Van den Berghe, H.; Cassiman, J.-J. : Mapping of human fibronectin receptor beta subunit gene to chromosome 10. *Somat. Cell Molec. Genet.* 14: 99–104, 1988. ; and
- [4485] Graus–Porta, D.; Blaess, S.; Senften, M.; Littlewood–Evans, A.; Damsky, C.; Huang, Z.; Orban, P.; Klein, R.; Schittny, J. C.; Muller, U. : Beta–1–class integrins regulate the development.
- [4486] Further studies establishing the function and utilities of ITGB1 are found in John Hopkins OMIM database record ID 135630, and in cited publications numbered 762–77 and 796 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rhodopsin (opsin 2, rod pigment) (retinitis pigmentosa 4, autosomal dominant) (RHO, Accession NM_000539) is another VGAM154 host target gene. RHO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHO BINDING SITE, designated SEQ ID:754, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4487] Another function of VGAM154 is therefore inhibition of Rhodopsin (opsin 2, rod pigment) (retinitis pigmentosa 4, autosomal dominant) (RHO, Accession NM_000539). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHO. X-prolyl Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399) is another VGAM154 host target gene. XPNPEP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XPNPEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPNPEP2 BINDING SITE, designated SEQ ID:1015, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4488] Another function of VGAM154 is therefore inhibition of X-

prolyl Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399), a gene which is a membrane-associated X-prolyl metallopeptidase. Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPNPEP2. The function of XPNPEP2 has been established by previous studies. Aminopeptidase P is a widely distributed hydrolase that is specific for N-terminal imido bonds, which are common to several collagen degradation products, neuropeptides, vasoactive peptides, and cytokines. Structurally, the enzyme is a member of the 'pita bread fold' family and occurs in mammalian tissues in both soluble and GPI-anchored membrane-bound forms. By RT-PCR using degenerate oligonucleotides based on the pig aminopeptidase P amino acid sequence, and by 5-prime and 3-prime RACE, Venema et al. (1997) isolated human kidney and lung cDNAs encoding XPNPEP2. The deduced XPNPEP2 protein has 673 amino acids and an estimated molecular mass of 75,490 Da. The authors stated that the human and pig XPNPEP2 amino acid sequences show significant evolutionary divergence, with 83% identity; 5 of 6 potential N-glycosylation sites, and 5 of 6 cysteine residues that are potentially involved in

disulfide bond formation, are conserved. Northern blot analysis detected a 3.5-kb XPNPEP2 transcript in human kidney, lung, heart, placenta, liver, small intestine, and colon, but not in brain, skeletal muscle, pancreas, spleen, thymus, prostate, testis, ovary, or leukocytes. Based on these results and on RT-PCR studies, Venema et al. (1997) suggested that the membrane-bound form and the soluble form, which is found in brain and leukocytes, are the products of 2 different genes or of alternative splicing of a single primary transcript. Women with balanced translocations between the long arm of the X chromosome and an autosome frequently suffer premature ovarian failure (POF; 311360). Two critical regions for POF which extend from Xq13 to Xq22 and from Xq22 to Xq26 have been identified by cytogenetic studies. To gain insight into the mechanism(s) responsible for ovarian failure in women with X/autosome translocations, Prueitt et al. (2000) molecularly characterized the translocation breakpoints of 9 X chromosomes. They mapped the breakpoints using somatic cell hybrids retaining the derivative autosome and densely spaced markers from the X-chromosome physical map. One of the POF-associated breakpoints in a critical region (Xq25) mapped to a sequenced PAC clone. The

translocation disrupts XPNPEP2. XPNPEP2 mRNA was detected in fibroblasts that carried the translocation, suggesting that this gene at least partially escapes X inactivation. Although the physiologic substrates for the enzyme were not known, Prueitt et al. (2000) suggested that XPNPEP2 is a candidate gene for POF.

[4489] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4490] Venema, R. C.; Ju, H.; Zou, R.; Venema, V. J.; Ryan, J. W. : Cloning and tissue distribution of human membrane-bound aminopeptidase P. *Biochim. Biophys. Acta* 1354: 45–48, 1997. ; and

[4491] Prueitt, R. L.; Ross, J. L.; Zinn, A. R. : Physical mapping of nine Xq translocation breakpoints and identification of XPNPEP2 as a premature ovarian failure candidate gene. *Cytogenet.*

[4492] Further studies establishing the function and utilities of XPNPEP2 are found in John Hopkins OMIM database record ID 300145, and in cited publications numbered 215–217 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ12700 (Accession NM_024910) is another VGAM154 host target

gene. FLJ12700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:2110, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4493] Another function of VGAM154 is therefore inhibition of FLJ12700 (Accession NM_024910). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. FLJ13291 (Accession NM_032178) is another VGAM154 host target gene. FLJ13291 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13291 BINDING SITE, designated SEQ ID:2234, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4494] Another function of VGAM154 is therefore inhibition of FLJ13291 (Accession NM_032178). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13291. FLJ20811 (Accession XM_040532) is another VGAM154 host target gene. FLJ20811 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20811 BINDING SITE, designated SEQ ID:2782, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4495] Another function of VGAM154 is therefore inhibition of FLJ20811 (Accession XM_040532). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20811. KIAA1643 (Accession XM_035371) is another VGAM154 host target gene. KIAA1643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1643 BINDING SITE, designated SEQ ID:2693, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4496] Another function of VGAM154 is therefore inhibition of KIAA1643 (Accession XM_035371). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1643. KIAA1755 (Accession XM_028810) is another VGAM154 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:2596, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4497] Another function of VGAM154 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1755. KIAA1762 (Accession XM_033370) is another VGAM154 host target gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:2669, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4498] Another function of VGAM154 is therefore inhibition of KIAA1762 (Accession XM_033370). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1762. MGC13033 (Accession NM_031447) is another VGAM154 host target gene. MGC13033 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13033 BINDING SITE, designated SEQ ID:2199, to the nucleotide sequence of VGAM154 RNA, herein designated

VGAM RNA, also designated SEQ ID:489.

[4499] Another function of VGAM154 is therefore inhibition of MGC13033 (Accession NM_031447). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13033. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 3 (SLC7A3, Accession NM_032803) is another VGAM154 host target gene. SLC7A3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC7A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A3 BINDING SITE, designated SEQ ID:2281, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4500] Another function of VGAM154 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 3 (SLC7A3, Accession NM_032803). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A3. LOC112609 (Accession

XM_053013) is another VGAM154 host target gene.

LOC112609 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112609 BINDING SITE, designated SEQ ID:2960, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4501] Another function of VGAM154 is therefore inhibition of LOC112609 (Accession XM_053013). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112609. LOC157349 (Accession XM_088298) is another VGAM154 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:3201, to the nucleotide sequence of VGAM154 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:489.

[4502] Another function of VGAM154 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC90625 (Accession XM_033004) is another VGAM154 host target gene. LOC90625 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90625 BINDING SITE, designated SEQ ID:2662, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:489.

[4503] Another function of VGAM154 is therefore inhibition of LOC90625 (Accession XM_033004). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90625. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 155 (VGAM155) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4504] VGAM155 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM155 was detected is described hereinabove with reference to Figs. 1–8.

[4505] VGAM155 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM155 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4506] VGAM155 gene encodes a VGAM155 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM155 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM155 precursor RNA is designated SEQ ID:141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:141 is located at position 80298 relative to the genome of Vaccinia Virus.

[4507] VGAM155 precursor RNA folds onto itself, forming

VGAM155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4508] An enzyme complex designated DICER COMPLEX, `dices` the VGAM155 folded precursor RNA into VGAM155 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM155 RNA is designated SEQ ID:490, and is provided hereinbelow with reference to the sequence listing part.

[4509] VGAM155 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM155 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM155 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4510] VGAM155 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM155 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM155 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM155 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM155 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4511] The complementary binding of VGAM155 RNA, herein designated VGAM RNA, to host target binding sites on VGAM155 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM155 host target RNA into VGAM155 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4512] It is appreciated that VGAM155 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM155 host target genes. The mRNA of each one of this plurality of VGAM155 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM155 RNA, herein designated VGAM RNA, and which when bound by VGAM155 RNA causes inhibition of translation of respective one or more VGAM155 host target proteins.

[4513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM155 gene, herein designated VGAM GENE, on one or more VGAM155 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4514] It is yet further appreciated that a function of VGAM155 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM155 correlate with, and may be deduced from, the identity of the host target genes which VGAM155 binds and inhibits, and the

function of these host target genes, as elaborated hereinbelow.

[4515] Nucleotide sequences of the VGAM155 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM155 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM155 are further described hereinbelow with reference to Table 1.

[4516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM155 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM155 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4517] As mentioned hereinabove with reference to Fig. 1, a function of VGAM155 gene, herein designated VGAM is inhibition of expression of VGAM155 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM155 correlate with, and may be deduced from, the identity of the target genes which VGAM155 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[4518] Mannosyl (alpha-1,3-)-glycoprotein Beta-1,4-N-acetylglucosaminyltransferase, Isoenzyme B (MGAT4B, Accession NM_054013) is a VGAM155 host target gene. MGAT4B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGAT4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT4B BINDING SITE, designated SEQ ID:2360, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4519] A function of VGAM155 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein Beta-1,4-N-acetylglucosaminyltransferase, Isoenzyme B (MGAT4B, Accession NM_054013). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT4B. Protein Kinase, CAMP-dependent, Regulatory, Type II, Alpha (PRKAR2A, Accession NM_004157) is another VGAM155 host target gene. PRKAR2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PRKAR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR2A BINDING SITE, designated SEQ ID:1091, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4520] Another function of VGAM155 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type II, Alpha (PRKAR2A, Accession NM_004157), a gene which mediates membrane association by binding to anchoring proteins, including the map2 kinase. Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR2A. The function of PRKAR2A has been established by previous studies. See 188830. Phosphorylation by cAMP-dependent protein kinases is essential for sperm motility. A cAMP-dependent protein kinase is bound to sperm flagella by a regulatory subunit (RII). Oyen et al. (1989) observed high testis-specific expression of a human homolog to the rat RII-alpha mRNA induced in haploid germ cells. They cloned a human cDNA that encodes a 404-amino acid polypeptide with a region (amino acids

45–75) divergent from that of the previously published mouse and rat sequences. By PCR and Southern blot analysis of somatic cell hybrid mapping panels and by radiation hybrid analysis, Tasken et al. (1998) mapped the PRKAR2A gene to chromosome 3p21.3–p21.2.

[4521] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4522] Oyen, O.; Myklebust, F.; Scott, J. D.; Hansson, V.; Jahnsen, T. : Human testis cDNA for the regulatory subunit RII alpha of cAMP-dependent protein kinase encodes an alternate amino-terminal region. FEBS Lett. 246: 57–64, 1989. ; and

[4523] Tasken, K.; Naylor, S. L.; Solberg, R.; Jahnsen, T. : Mapping of the gene encoding the regulatory subunit RII-alpha of cAMP-dependent protein kinase (locus PRKAR2A) to human chromosome r.

[4524] Further studies establishing the function and utilities of PRKAR2A are found in John Hopkins OMIM database record ID 176910, and in cited publications numbered 279–280 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD,

Accession NM_005063) is another VGAM155 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:1177, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4525] Another function of VGAM155 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD has been established by previous studies. Stearoyl-CoA desaturase (SCD; EC 1.14.99.5) is an iron-containing enzyme that catalyzes a rate-limiting step in the synthesis of unsaturated fatty acids. The principal product of SCD is oleic acid, which is formed by desaturation of stearic acid. The ratio of stearic acid to oleic acid has been implicated in the regulation of cell growth and differentiation through effects on cell-membrane fluidity

and signal transduction (Zhang et al. (1999)). Thiede et al. (1986) isolated cDNAs encoding rat SCD. By RT-PCR of adipose tissue RNA with primers based on the sequence of rat SCD, Li et al. (1994) isolated a partial human SCD cDNA. Using RNase protection assays, the authors found that human SCD was expressed at higher levels in colon and esophageal carcinomas than in the counterpart normal tissues. Animal model experiments lend further support to the function of SCD. SCD is a central lipogenic enzyme catalyzing the synthesis of monounsaturated fatty acids, mainly oleate (C18:1) and palmitoleate (C16:1), which are components of membrane phospholipids, triglycerides, wax esters, and cholesterol esters. Several SCD isoforms (SCD1, -2, and -3) exist in the mouse. Ntambi et al. (2002) showed that mice with a targeted disruption of the SCD1 isoform had reduced body adiposity, increased insulin (OMIM Ref. No. 176730) sensitivity, and resistance to diet-induced weight gain. The protection from obesity involved increased energy expenditure and increased oxygen consumption. Compared with wild-type mice, the SCD1-/- mice had increased levels of plasma ketone bodies but reduced levels of plasma insulin and leptin. In these homozygous null mice, the expression

of several genes of lipid oxidation was upregulated, whereas lipid synthesis genes were downregulated. These observations suggested that a consequence of SCD1 deficiency is an activation of lipid oxidation in addition to reduced triglyceride synthesis and storage.

[4526] It is appreciated that the abovementioned animal model for SCD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4527] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4528] Ntambi, J. M.; Miyazaki, M.; Stoehr, J. P.; Lan, H.; Kendzierski, C. M.; Yandell, B. S.; Song, Y.; Cohen, P.; Friedman, J. M.; Attie, A. D. : Loss of stearoyl-CoA desaturase-1 function protects mice against adiposity. Proc. Nat. Acad. Sci. 99: 11482-11486, 2002. ; and

[4530] Further studies establishing the function and utilities of SCD are found in John Hopkins OMIM database record ID

604031, and in cited publications numbered 72 and 1750–1754 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp761H079 (Accession NM_144996) is another VGAM155 host target gene. DKFZp761H079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761H079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761H079 BINDING SITE, designated SEQ ID:2506, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4531] Another function of VGAM155 is therefore inhibition of DKFZp761H079 (Accession NM_144996). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H079. KIAA0417 (Accession XM_048898) is another VGAM155 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:2910, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4532] Another function of VGAM155 is therefore inhibition of KIAA0417 (Accession XM_048898). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. LPS-responsive Vesicle Trafficking, Beach and Anchor Containing (LRBA, Accession NM_006726) is another VGAM155 host target gene. LRBA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRBA BINDING SITE, designated SEQ ID:1327, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4533] Another function of VGAM155 is therefore inhibition of LPS-responsive Vesicle Trafficking, Beach and Anchor Containing (LRBA, Accession NM_006726). Accordingly, utilities of VGAM155 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with LRBA. Reserved (SYAP1, Accession NM_032796) is another VGAM155 host target gene. SYAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYAP1 BINDING SITE, designated SEQ ID:2279, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4534] Another function of VGAM155 is therefore inhibition of Reserved (SYAP1, Accession NM_032796). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYAP1. LOC143188 (Accession XM_096387) is another VGAM155 host target gene. LOC143188 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143188 BINDING SITE, designated SEQ ID:3264, to

the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4535] Another function of VGAM155 is therefore inhibition of LOC143188 (Accession XM_096387). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143188. LOC157292 (Accession XM_098740) is another VGAM155 host target gene. LOC157292 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157292 BINDING SITE, designated SEQ ID:3378, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:490.

[4536] Another function of VGAM155 is therefore inhibition of LOC157292 (Accession XM_098740). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 156 (VGAM156) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4537] VGAM156 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM156 was detected is described hereinabove with reference to Figs. 1–8.

[4538] VGAM156 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4539] VGAM156 gene encodes a VGAM156 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM156 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM156 precursor RNA is designated SEQ ID:142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:142 is located at position 79822 relative to the genome of Vaccinia Virus.

[4540] VGAM156 precursor RNA folds onto itself, forming VGAM156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4541] An enzyme complex designated DICER COMPLEX, `dices` the VGAM156 folded precursor RNA into VGAM156 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM156 RNA is designated SEQ ID:491, and is provided hereinbelow with reference to the sequence listing part.

[4542] VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM156 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM156 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4543] VGAM156 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM156 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM156 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM156 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM156 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4544] The complementary binding of VGAM156 RNA, herein designated VGAM RNA, to host target binding sites on VGAM156 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM156 host target RNA into VGAM156 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4545] It is appreciated that VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM156 host target genes. The mRNA of each one of this plurality of VGAM156 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM156 RNA, herein designated VGAM RNA, and which when bound by VGAM156 RNA causes inhibition of translation of respective one or more VGAM156 host target proteins.

[4546] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM156 gene, herein designated VGAM GENE, on one or more VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4547] It is yet further appreciated that a function of VGAM156 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM156 correlate with, and may be deduced from, the identity of the host

target genes which VGAM156 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4548] Nucleotide sequences of the VGAM156 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM156 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM156 are further described hereinbelow with reference to Table 1.

[4549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM156 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM156 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4550] As mentioned hereinabove with reference to Fig. 1, a function of VGAM156 gene, herein designated VGAM is inhibition of expression of VGAM156 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM156 correlate with, and may be deduced from, the identity of the target genes which VGAM156

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4551] Chromosome 18 Open Reading Frame 1 (C18orf1, Accession XM_012723) is a VGAM156 host target gene. C18orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C18orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C18orf1 BINDING SITE, designated SEQ ID:2561, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4552] A function of VGAM156 is therefore inhibition of Chromosome 18 Open Reading Frame 1 (C18orf1, Accession XM_012723), a gene which displays selective expression, regulated spatially and temporally. Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C18orf1. The function of C18orf1 has been established by previous studies. By cDNA selection, Yoshikawa et al. (1997) isolated several brain-derived transcripts on chromosome 18, including C18ORF1, which maps to 18p11.2.

Yoshikawa et al. (1998) further characterized C18ORF1 and identified 2 major classes of transcripts distinguished by their unique upstream regions, with the beta variants representing N-terminal-truncated versions of the alpha isoforms. The alpha-specific exons 1 to 3 are missing in beta; instead, the downstream sequence of intron C is present in the mature mRNA (exon 4a), which combines with exon 4b to create the upstream exon for beta. The differential splicing of exon 5 leads to the expression of 2 alpha and 2 beta subclasses. Alpha-1 and beta-1 share identical sequences with alpha-2 and beta-2, respectively, except for the loss of exon 5 in alpha-2 and beta-2. The differences between the alpha and the beta classes of transcripts predict 2 potentially distinct promoters for the C18ORF1 gene. Yoshikawa et al. (1998) also presented evidence of RNA editing in the 5-prime untranslated region of the beta-2 variant. Yoshikawa et al. (1998) demonstrated that the C18ORF1 transcripts display selective expression, regulated spatially and temporally. The cortical and subcortical structures of brain appear to express high levels of alpha, in both fetal and adult stages. The major 9-kb transcript of C18ORF1, detectable in early development in kidney, liver, and lung, is indiscernible in

these tissues in the adult. The expression profile displayed by beta is more complex. Northern blots generated from adult tissues are devoid of hybridization signals with beta but fetal tissues exhibit a 4-kb transcript. In contrast, all subcortical areas of adult brain show relatively intense signals at 6.8 kb, implying a different mechanism of transcript processing in adult brain structures. Northern blot analysis also detected several minor bands in the alpha and beta isoforms.

[4553] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4554] Yoshikawa, T.; Sanders, A. R.; Esterling, L. E.; Detera-Wadleigh, S. D. : Multiple transcriptional variants and RNA editing in C18orf1, a novel gene with LDLRA and trans-membrane domains on 18p11.2. Genomics 47: 246-257, 1998. ; and

[4555] Yoshikawa, T.; Sanders, A. R.; Esterling, L. E.; Overharser, J.; Garnes, J. A.; Lennon, G.; Grewal, R.; Detera-Wadleigh, S. D. : Isolation of chromosome 18-specific brain transcripts as.

[4556] Further studies establishing the function and utilities of C18orf1 are found in John Hopkins OMIM database record

ID 606571, and in cited publications numbered 1407–1408 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM_001889) is another VGAM156 host target gene. CRYZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRYZ BINDING SITE, designated SEQ ID:866, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4557] Another function of VGAM156 is therefore inhibition of Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM_001889), a gene which may act in the detoxification of xenobiotics. Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRYZ. The function of CRYZ has been established by previous studies. In addition to the alpha, beta, and gamma crystallin families, which are present in the ocular lenses of all vertebrates, a number of other crystallins have been found to be present in high

amounts in lenses from phylogenetically restricted groups. Most of these 'taxon-specific' crystallins are pyridine nucleotide-dependent oxidoreductases that are also present at enzymatic levels in nonlenticular tissues. The acquisition of this new function as a lens crystallin generally occurs without gene duplication and apparently without affecting the catalytic role of the enzyme. Zeta-crystallin/quinone reductase was initially described as a major protein in the lens of the guinea pig (Huang et al., 1987), in which a mutation in the gene is associated with hereditary cataracts (Rodriguez et al., 1992). It was later found to be also present in high amounts in the lens of camels (Garland et al., 1991) and at enzymatic levels in a number of nonlenticular tissues of various species. In the lens of guinea pigs and camels, it comprises about 10% of the total soluble protein. Gonzalez et al. (1994) isolated and characterized the human zeta-crystallin gene and its processed pseudogene. The functional gene is composed of 9 exons and spans about 20 kb. The 5-prime flanking region of the gene is rich in G and C (58%) and lacks TATA and CAAT boxes. Previous analysis of the guinea pig gene revealed the presence of 2 different promoters, one responsible for the high lens-specific expression and the

other for expression at the enzymatic level in numerous tissues. A comparative analysis with the guinea pig gene showed that a region of approximately 2.5 kb that includes the promoter responsible for the high expression in the lens in the guinea pig is not present in the human gene. By Southern analysis of human/mouse somatic cell hybrids, Heinzmann et al. (1994) assigned the CRYZ gene to human chromosome 1 and regionalized the assignment to 1p31–p22 by fluorescence in situ hybridization. They also identified 5 RFLPs

[4558] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4559] Gonzalez, P.; Rao, P. V.; Zigler, J. S., Jr. : Organization of the human zeta-crystallin/quinone reductase gene (CRYZ). *Genomics* 21: 317–324, 1994. ; and

[4560] Heinzmann, C.; Kojis, T. L.; Gonzalez, P.; Rao, P. V.; Zigler, J. S., Jr.; Polymeropoulos, M. H.; Klisak, I.; Sparkes, R. S.; Mohandas, T.; Bateman, J. B. : Assignment of the zeta-crysta.

[4561] Further studies establishing the function and utilities of CRYZ are found in John Hopkins OMIM database record ID 123691, and in cited publications numbered 2676–2680

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM_012471) is another VGAM156 host target gene. TRPC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC5 BINDING SITE, designated SEQ ID:1434, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4562] Another function of VGAM156 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM_012471). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC5. DAP13 (Accession NM_018838) is another VGAM156 host target gene. DAP13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAP13 BINDING SITE, designated SEQ ID:1862, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4563] Another function of VGAM156 is therefore inhibition of DAP13 (Accession NM_018838). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAP13. DKFZP564O0463 (Accession NM_014156) is another VGAM156 host target gene. DKFZP564O0463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0463 BINDING SITE, designated SEQ ID:1481, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4564] Another function of VGAM156 is therefore inhibition of DKFZP564O0463 (Accession NM_014156). Accordingly, utilities of VGAM156 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP564O0463. Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613) is another VGAM156 host target gene. GRID1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:2822, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4565] Another function of VGAM156 is therefore inhibition of Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1. MGC30052 (Accession NM_144721) is another VGAM156 host target gene. MGC30052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC30052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of MGC30052 BINDING SITE, designated SEQ ID:2499, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4566] Another function of VGAM156 is therefore inhibition of MGC30052 (Accession NM_144721). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC30052. MGC32104 (Accession NM_144684) is another VGAM156 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:2494, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4567] Another function of VGAM156 is therefore inhibition of MGC32104 (Accession NM_144684). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. Sodium Channel, Voltage-gated, Type IX, Al-

pha Polypeptide (SCN9A, Accession NM_002977) is another VGAM156 host target gene. SCN9A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCN9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN9A BINDING SITE, designated SEQ ID:975, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4568] Another function of VGAM156 is therefore inhibition of Sodium Channel, Voltage-gated, Type IX, Alpha Polypeptide (SCN9A, Accession NM_002977). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN9A. Serine/threonine Kinase 17a (apoptosis-inducing) (STK17A, Accession NM_004760) is another VGAM156 host target gene. STK17A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK17A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK17A BINDING SITE,

designated SEQ ID:1154, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4569] Another function of VGAM156 is therefore inhibition of Serine/threonine Kinase 17a (apoptosis-inducing) (STK17A, Accession NM_004760). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK17A. LOC148738 (Accession NM_145277) is another VGAM156 host target gene. LOC148738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148738 BINDING SITE, designated SEQ ID:2519, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:491.

[4570] Another function of VGAM156 is therefore inhibition of LOC148738 (Accession NM_145277). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148738. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 157 (VGAM157) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4571] VGAM157 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM157 was detected is described hereinabove with reference to Figs. 1–8.

[4572] VGAM157 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM157 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4573] VGAM157 gene encodes a VGAM157 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM157 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM157 precursor RNA is designated SEQ ID:143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:143 is

located at position 79119 relative to the genome of Vac-
cinia Virus.

[4574] VGAM157 precursor RNA folds onto itself, forming VGAM157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4575] An enzyme complex designated DICER COMPLEX, `dices` the VGAM157 folded precursor RNA into VGAM157 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM157 RNA is designated SEQ ID:492, and is provided hereinbelow with reference to the sequence listing part.

[4576] VGAM157 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM157 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM157 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[4577] VGAM157 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM157 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM157 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM157 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM157 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[4578] The complementary binding of VGAM157 RNA, herein designated VGAM RNA, to host target binding sites on VGAM157 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM157 host target RNA into VGAM157 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4579] It is appreciated that VGAM157 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM157 host target genes. The mRNA of each one of this plurality of VGAM157 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM157 RNA, herein designated VGAM RNA, and which when bound by VGAM157 RNA causes inhibition of translation of respective one or more VGAM157

host target proteins.

[4580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM157 gene, herein designated VGAM GENE, on one or more VGAM157 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4581] It is yet further appreciated that a function of VGAM157 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM157 correlate with, and may be deduced from, the identity of the host target genes which VGAM157 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4582] Nucleotide sequences of the VGAM157 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM157 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM157 are further described hereinbelow with reference to Table 1.

[4583] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM157 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM157 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4584] As mentioned hereinabove with reference to Fig. 1, a function of VGAM157 gene, herein designated VGAM is inhibition of expression of VGAM157 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM157 correlate with, and may be deduced from, the identity of the target genes which VGAM157 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4585] Bleomycin Hydrolase (BLMH, Accession NM_000386) is a VGAM157 host target gene. BLMH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLMH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLMH BINDING SITE, designated SEQ ID:734, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4586] A function of VGAM157 is therefore inhibition of Bleomycin Hydrolase (BLMH, Accession NM_000386), a gene which is a cysteine protease that inactivates bleomycin. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLMH. The function of BLMH has been established by previous studies. Using PCR-SSCP, Bromme et al. (1996) and Montoya et al. (1997) found a 1450A-G polymorphism of the BMH gene that re-

sulted in an ile443-to-val (I443V) conserved amino acid substitution in the carboxy terminus of the protein (602403.0001). BMH is suspected of being the unknown beta secretase that cleaves off the amyloid beta fragment from the amyloid precursor protein (APP; 104760) associated with Alzheimer disease (AD). In pooled AD cases and controls, the frequency of the 1450A and 1450G alleles were statistically indistinguishable. The G/G homozygote genotype distribution, however, was significantly different between AD cases (12.7%) and controls (6.6%); (P less than 0.001). Significant differences were not seen in the A/A homozygote and A/G heterozygote genotype distributions. Further studies by Montoya et al. (1998) indicated that the frequency of the G/G homozygote was significantly higher in AD cases than in controls only in the non-APOE4 (see OMIM Ref. No. 107741) group (15.9% in cases vs 4.7% in controls). The odds ratio for developing AD with BMH G/G genotype in the absence of an APOE4 allele was 3.81; in the presence of an APOE4 allele, the odds ratio was 0.98. Farrer et al. (1998) were unable to confirm this association in a sample of 621 Caucasian Alzheimer patients drawn from 4 North American university-based research centers. Susceptibility to bleomycin-induced

chromatid breaks in cultured peripheral blood lymphocytes may reflect the way a person deals with carcinogenic challenges (Hsu et al., 1989). This susceptibility, also referred to as mutagen sensitivity, has been found to be increased in patients with environmentally related cancers, including cancers of the head and neck, lung, and colon. In combination with carcinogenic exposure, this susceptibility can greatly influence cancer risk. Cloos et al. (1999) determined the number of bleomycin-induced breaks per cell for 135 healthy volunteers without cancer. These individuals were from 53 different pedigrees and included 25 monozygotic twin pairs, 14 pairs of dizygotics, and 14 families selected on the basis of a first-degree relative who was successfully treated for head and neck cancer and who had no sign of recurrence for at least 1 year. Results showed no evidence for the influence of a shared family environment on bleomycin-induced chromatid breaks. On the other hand, genetic influences were statistically significant and accounted for 75% of the total variance.

[4587] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [4588] Bromme, D.; Rossi, A. B.; Smeekens, S. P.; Anderson, D. C.; Payan, D. G. : Human bleomycin hydrolase: molecular cloning, sequencing, functional expression, and enzymatic characterization. *Biochemistry* 35: 6706–6714, 1996. ; and
- [4589] Hsu, T. C.; Johnston, D. A.; Cherry, L. M.; Ramkissoo, D.; Schantz, S. P.; Jessup, J. M.; Winn, R. J.; Shirley, L.; Furlong, C. : Sensitivity to genotoxic effects of bleomycin in human.
- [4590] Further studies establishing the function and utilities of BLMH are found in John Hopkins OMIM database record ID 602403, and in cited publications numbered 1461–147 and 1470–1471 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Biliverdin Reductase B (flavin reductase (NADPH)) (BLVRB, Accession NM_000713) is another VGAM157 host target gene. BLVRB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLVRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLVRB BINDING SITE, designated SEQ ID:768, to the nucleotide sequence of VGAM157 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:492.

[4591] Another function of VGAM157 is therefore inhibition of Biliverdin Reductase B (flavin reductase (NADPH)) (BLVRB, Accession NM_000713), a gene which involves in protecting cells from oxidative damage or in regulating iron metabolism. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLVRB. The function of BLVRB has been established by previous studies. The final step in heme metabolism in mammals is catalyzed by the cytosolic enzyme biliverdin reductase (EC 1.3.1.24). Yamaguchi et al. (1993) isolated 2 biliverdin reductases. BLVRA (OMIM Ref. No. 109750), which they called biliverdin-IX alpha-reductase, is a major component of human adult liver and is identical to the enzyme previously reported as biliverdin reductase. BLVRB, which they called biliverdin-IX beta-reductase, is found predominantly in fetal liver. NADPH-flavin reductase (FLR) of erythrocytes has been studied as one of the methemoglobin-reducing enzymes. Chikuba et al. (1994) isolated a cDNA from a human reticulocyte library that encodes a predicted 206-amino acid FLR. Western blots of rat tissues showed highest levels of FLR in the erythrocytes and liver. Northern blots indicated a 1.1-kb

transcript in human tissues.

[4592] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4593] Yamaguchi, T.; Komuro, A.; Nakano, Y.; Tomita, M.; Nakajima, H. : Complete amino acid sequence of biliverdin-IX beta reductase from human liver. Biochem. Biophys. Res. Commun. 197: 1518–1523, 1993. ; and

[4594] Chikuba, K.; Yubisui, T.; Shirabe, K.; Takeshita, M. : Cloning and nucleotide sequence of a cDNA of the human erythrocyte NADPH-flavin reductase. Biochem. Biophys. Res. Commun. 198: 1170.

[4595] Further studies establishing the function and utilities of BLVRB are found in John Hopkins OMIM database record ID 600941, and in cited publications numbered 317–319 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 7-dehydrocholesterol Reductase (DHCR7, Accession NM_001360) is another VGAM157 host target gene. DHCR7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DHCR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DHCR7 BINDING SITE, designated SEQ ID:821, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4596] Another function of VGAM157 is therefore inhibition of 7-dehydrocholesterol Reductase (DHCR7, Accession NM_001360). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR7. Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_023107) is another VGAM157 host target gene. FGFR1 BINDING SITE1 and FGFR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 and FGFR1 BINDING SITE2, designated SEQ ID:2032 and SEQ ID:2034 respectively, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4597] Another function of VGAM157 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_023107). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. 5'-nucleotidase, Cytosolic III (NT5C3, Accession NM_016489) is another VGAM157 host target gene. NT5C3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NT5C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5C3 BINDING SITE, designated SEQ ID:1689, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4598] Another function of VGAM157 is therefore inhibition of 5'-nucleotidase, Cytosolic III (NT5C3, Accession NM_016489). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C3. Otoraplin (OTOR, Accession NM_020157) is another VGAM157 host target gene. OTOR BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by OTOR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTOR BINDING SITE, designated SEQ ID:1894, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4599] Another function of VGAM157 is therefore inhibition of Otoraplin (OTOR, Accession NM_020157), a gene which plays a role in the early chondrogenesis of the periotic mesenchyme. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTOR. The function of OTOR has been established by previous studies. During large-scale analysis of human fetal cochlea EST sequences, Robertson et al. (2000) identified a novel gene, designated OTOR. They also isolated orthologous genes in mouse, chicken, and bullfrog by screening inner ear cDNA libraries. Rendtorff et al. (2001) independently identified OTOR, which they called MIA-like (MIAL), during a search for cochlea-specific EST clusters. Cohen-Salmon et al. (2000) cloned the mouse Otor gene, which they called fibrocyte-derived protein (Fdp), using a subtracted mouse

cochlea cDNA library and 5-prime RACE. Human OTOR encodes a 128-amino acid protein with a predicted secretion signal peptide. The protein shares high sequence identity with the mouse (90%), chicken (80%), and bullfrog (60%) orthologs and with the related human CDRAP/MIA protein (OMIM Ref. No. 601340) (43%). By expressing OTOR in mammalian cell cultures, Rendtorff et al. (2001) showed that OTOR is translated as an approximately 15-kD polypeptide that is assembled into a covalently linked homodimer, modified by sulfation, and secreted from the cells via the Golgi apparatus. By Northern blot analysis, Robertson et al. (2000) detected expression of a major 1.1-kb and minor 1.8- and 4-kb OTOR transcripts in human cochlea. Using RT-PCR and in situ hybridization, Rendtorff et al. (2001) detected OTOR expression specific to a cell layer beneath the sensory epithelium of cochlea and vestibule of human fetal inner ear. Rendtorff et al. (2001) reported a frequent polymorphism in the translation initiation codon of OTOR (ACG instead of ATG). Of 505 unrelated individuals analyzed, 9.5% were ACG/ATG heterozygous. The ACG allele failed to direct synthesis of the OTOR protein in transfected cells. Rendtorff et al. (2001) concluded that OTOR may contribute to inner ear

dysfunction in humans.

[4600] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4601] Rendtorff, N. D.; Frodin, M.; Attie-Bitach, T.; Vekemans, M.; Tommerup, N. : Identification and characterization of an inner ear-expressed human melanoma inhibitory activity (MIA)-like gene (MIAL) with a frequent polymorphism that abolishes translation. *Genomics* 71: 40-52, 2001. ; and

[4602] Robertson, N. G.; Heller, S.; Lin, J. S.; Resendes, B. L.; Weremowicz, S.; Denis, C. S.; Bell, A. M.; Hudspeth, A. J.; Morton, C. C. : A novel conserved cochlear gene, OTOR: identification.

[4603] Further studies establishing the function and utilities of OTOR are found in John Hopkins OMIM database record ID 606067, and in cited publications numbered 1004-1006 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoribosyl Pyrophosphate Synthetase-associated Protein 2 (PRPSAP2, Accession NM_002767) is another VGAM157 host target gene. PRPSAP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

PRPSAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPSAP2 BINDING SITE, designated SEQ ID:954, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4604] Another function of VGAM157 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase-associated Protein 2 (PRPSAP2, Accession NM_002767), a gene which may be a negative regulator of phosphoribosyl pyrophosphate synthesis. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPSAP2. The function of PRPSAP2 has been established by previous studies. Phosphoribosylpyrophosphate (PRPP) is a primary substrate and a critical control factor for de novo synthesis of purine and pyrimidine nucleotides, histidine, tryptophan, and NAD. The enzyme PRPP synthetase (PRS), which catalyzes the formation of PRPP, exists in an aggregate composed of 2 catalytic subunits, PRSI (OMIM Ref. No. 311850) and PRSII (OMIM Ref. No. 311860), and 2 associated subunits, PAP39 (OMIM Ref. No. 601249) and PAP41.

By searching an EST database for sequences related to PAP39, Katashima et al. (1998) identified cDNAs encoding PAP41. The predicted 369–amino acid protein exhibited 72%, 51%, and 50% sequence identity with PAP39, PRSI, and PRSII, respectively. The rat and human PAP41 proteins are 99% identical. Northern blot analysis revealed that PAP41 is expressed as a 2.1–kb mRNA in several human cell lines. By fluorescence in situ hybridization, Katashima et al. (1998) mapped the PRPSAP2 gene to 17p12–p11.2.

[4605] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4606] Katashima, R.; Iwahana, H.; Fujimura, M.; Yamaoka, T.; Ishizuka, T.; Tatibana, M.; Itakura, M. : Molecular cloning of a human cDNA for the 41–kDa phosphoribosylpyrophosphate synthetase–associated protein. *Biochim. Biophys. Acta* 1396: 245–250, 1998. ; and

[4607] Katashima, R.; Iwahana, H.; Fujimura, M.; Yamaoka, T.; Itakura, M. : Assignment of the human phosphoribosylpyrophosphate synthetase–associated protein 41 gene (PRPSAP2) to 17p11.2–p12. *G.*

[4608] Further studies establishing the function and utilities of PRPSAP2 are found in John Hopkins OMIM database record

ID 603762, and in cited publications numbered 1746–1747 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 14 Open Reading Frame 4 (C14orf4, Accession XM_041104) is another VGAM157 host target gene. C14orf4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C14orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C14orf4 BINDING SITE, designated SEQ ID:2788, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4609] Another function of VGAM157 is therefore inhibition of Chromosome 14 Open Reading Frame 4 (C14orf4, Accession XM_041104). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf4. CG012 (Accession XM_096710) is another VGAM157 host target gene. CG012 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:3272, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4610] Another function of VGAM157 is therefore inhibition of CG012 (Accession XM_096710). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012. DKFZP434K2235 (Accession XM_096869) is another VGAM157 host target gene. DKFZP434K2235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434K2235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K2235 BINDING SITE, designated SEQ ID:3278, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4611] Another function of VGAM157 is therefore inhibition of DKFZP434K2235 (Accession XM_096869). Accordingly,

utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K2235. FLJ20699 (Accession NM_017931) is another VGAM157 host target gene. FLJ20699 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20699 BINDING SITE, designated SEQ ID:1766, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4612] Another function of VGAM157 is therefore inhibition of FLJ20699 (Accession NM_017931). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20699. FLJ23129 (Accession NM_024763) is another VGAM157 host target gene. FLJ23129 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23129 BINDING SITE,

designated SEQ ID:2088, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4613] Another function of VGAM157 is therefore inhibition of FLJ23129 (Accession NM_024763). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23129. HSPC065 (Accession NM_014157) is another VGAM157 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:1482, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4614] Another function of VGAM157 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. KIAA0960 (Accession XM_166543) is another VGAM157 host target gene. KIAA0960 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:3572, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4615] Another function of VGAM157 is therefore inhibition of KIAA0960 (Accession XM_166543). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0960. MGC12466 (Accession XM_086336) is another VGAM157 host target gene. MGC12466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12466 BINDING SITE, designated SEQ ID:3127, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4616] Another function of VGAM157 is therefore inhibition of

MGC12466 (Accession XM_086336). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12466. MGC12904 (Accession NM_031219) is another VGAM157 host target gene. MGC12904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12904 BINDING SITE, designated SEQ ID:2184, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4617] Another function of VGAM157 is therefore inhibition of MGC12904 (Accession NM_031219). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12904. MSTP028 (Accession NM_031954) is another VGAM157 host target gene. MSTP028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MSTP028 BINDING SITE, designated SEQ ID:2224, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4618] Another function of VGAM157 is therefore inhibition of MSTP028 (Accession NM_031954). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP028. Reserved (RAB24, Accession NM_130781) is another VGAM157 host target gene. RAB24 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB24 BINDING SITE, designated SEQ ID:2397, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4619] Another function of VGAM157 is therefore inhibition of Reserved (RAB24, Accession NM_130781). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB24. LOC113828 (Accession NM_138435) is an-

other VGAM157 host target gene. LOC113828 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC113828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113828 BINDING SITE, designated SEQ ID:2439, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4620] Another function of VGAM157 is therefore inhibition of LOC113828 (Accession NM_138435). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113828. LOC152300 (Accession XM_087432) is another VGAM157 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:3169, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4621] Another function of VGAM157 is therefore inhibition of LOC152300 (Accession XM_087432). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC197125 (Accession XM_113826) is another VGAM157 host target gene. LOC197125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197125 BINDING SITE, designated SEQ ID:3420, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4622] Another function of VGAM157 is therefore inhibition of LOC197125 (Accession XM_113826). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197125. LOC219848 (Accession XM_166170) is another VGAM157 host target gene. LOC219848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219848, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219848 BINDING SITE, designated SEQ ID:3528, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4623] Another function of VGAM157 is therefore inhibition of LOC219848 (Accession XM_166170). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219848. LOC51157 (Accession NM_016202) is another VGAM157 host target gene. LOC51157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51157 BINDING SITE, designated SEQ ID:1671, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4624] Another function of VGAM157 is therefore inhibition of LOC51157 (Accession NM_016202). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51157. LOC92270 (Accession XM_043989) is another VGAM157 host target gene. LOC92270 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92270 BINDING SITE, designated SEQ ID:2828, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:492.

[4625] Another function of VGAM157 is therefore inhibition of LOC92270 (Accession XM_043989). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92270. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 158 (VGAM158) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4626] VGAM158 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM158 was detected is described hereinabove with reference to Figs. 1–8.

[4627] VGAM158 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM158 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4628] VGAM158 gene encodes a VGAM158 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM158 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM158 precursor RNA is designated SEQ ID:144, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:144 is located at position 81571 relative to the genome of Vaccinia Virus.

[4629] VGAM158 precursor RNA folds onto itself, forming VGAM158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4630] An enzyme complex designated DICER COMPLEX, `dices` the VGAM158 folded precursor RNA into VGAM158 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM158 RNA is designated SEQ ID:493, and is provided hereinbelow with reference to the sequence listing part.

[4631] VGAM158 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM158 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4632] VGAM158 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM158 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM158 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[4633] The complementary binding of VGAM158 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM158 host target RNA into VGAM158 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4634] It is appreciated that VGAM158 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM158 host target genes. The mRNA of each one of this plurality of VGAM158 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM158 RNA, herein designated VGAM RNA, and which when bound by VGAM158 RNA causes inhibition of translation of respective one or more VGAM158 host target proteins.

[4635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM158 gene, herein designated VGAM GENE, on one or more VGAM158 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4636] It is yet further appreciated that a function of VGAM158 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM158 correlate with, and may be deduced from, the identity of the host target genes which VGAM158 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4637] Nucleotide sequences of the VGAM158 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM158 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM158 are further described hereinbelow with reference to Table 1.

[4638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM158 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM158 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4639] As mentioned hereinabove with reference to Fig. 1, a function of VGAM158 gene, herein designated VGAM is inhibition of expression of VGAM158 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM158 correlate with, and may be deduced from, the identity of the target genes which VGAM158 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4640] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781) is a VGAM158 host target gene. B3GALT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by B3GALT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT3 BINDING SITE, designated SEQ ID:1057, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:493.

[4641] A function of VGAM158 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT3. KIAA1985 (Accession NM_024577) is another VGAM158 host target gene. KIAA1985 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1985, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1985 BINDING SITE, designated SEQ ID:2066, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:493.

[4642] Another function of VGAM158 is therefore inhibition of

KIAA1985 (Accession NM_024577). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1985. MCM10 Minichromosome Maintenance Deficient 10 (*S. cerevisiae*) (MCM10, Accession NM_018518) is another VGAM158 host target gene. MCM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCM10 BINDING SITE, designated SEQ ID:1835, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:493.

[4643] Another function of VGAM158 is therefore inhibition of MCM10 Minichromosome Maintenance Deficient 10 (*S. cerevisiae*) (MCM10, Accession NM_018518). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCM10. LOC149707 (Accession XM_086641) is another VGAM158 host target gene. LOC149707 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149707, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149707 BINDING SITE, designated SEQ ID:3137, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:493.

[4644] Another function of VGAM158 is therefore inhibition of LOC149707 (Accession XM_086641). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149707. LOC200227 (Accession XM_114162) is another VGAM158 host target gene. LOC200227 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200227 BINDING SITE, designated SEQ ID:3446, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:493.

[4645] Another function of VGAM158 is therefore inhibition of LOC200227 (Accession XM_114162). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC200227. LOC255718 (Accession XM_174148) is another VGAM158 host target gene. LOC255718 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255718 BINDING SITE, designated SEQ ID:3741, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:493.

[4646] Another function of VGAM158 is therefore inhibition of LOC255718 (Accession XM_174148). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255718. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 159 (VGAM159) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4647] VGAM159 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM159 was detected is described hereinabove with reference to Figs. 1–8.

[4648] VGAM159 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4649] VGAM159 gene encodes a VGAM159 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM159 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM159 precursor RNA is designated SEQ ID:145, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:145 is located at position 81761 relative to the genome of Vaccinia Virus.

[4650] VGAM159 precursor RNA folds onto itself, forming VGAM159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4651] An enzyme complex designated DICER COMPLEX, `dices` the VGAM159 folded precursor RNA into VGAM159 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM159 RNA is designated SEQ ID:494, and is provided hereinbelow with reference to the sequence listing part.

[4652] VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM159 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4653] VGAM159 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM159 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM159 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4654] The complementary binding of VGAM159 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM159 host target RNA into VGAM159 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4655] It is appreciated that VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM159 host target genes. The mRNA of each one of this plurality of VGAM159 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM159 RNA, herein designated VGAM RNA, and which when bound by VGAM159 RNA causes inhibition of translation of respective one or more VGAM159 host target proteins.

[4656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM159 gene, herein designated VGAM GENE, on one or more VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4657] It is yet further appreciated that a function of VGAM159 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM159 correlate with, and may be deduced from, the identity of the host target genes which VGAM159 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4658] Nucleotide sequences of the VGAM159 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM159 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM159 are further described hereinbelow with reference to Table 1.

[4659] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM159 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM159 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4660] As mentioned hereinabove with reference to Fig. 1, a function of VGAM159 gene, herein designated VGAM is inhibition of expression of VGAM159 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM159 correlate with, and may be deduced from, the identity of the target genes which VGAM159 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4661] Desmoglein 3 (pemphigus vulgaris antigen) (DSG3, Accession NM_001944) is a VGAM159 host target gene. DSG3 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by DSG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSG3 BINDING SITE, designated SEQ ID:873, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4662] A function of VGAM159 is therefore inhibition of Desmoglein 3 (pemphigus vulgaris antigen) (DSG3, Accession NM_001944), a gene which is involved in the interaction of plaque proteins and intermediate filaments. Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSG3. The function of DSG3 has been established by previous studies. Pemphigus vulgaris (PV; 169610) and pemphigus foliaceus (PF) are autoimmune diseases of the skin which have as target antigens 2 different members of the desmoglein subfamily of the desmosomal cadherins: pemphigus vulgaris antigen (PVA, or desmoglein-3) in the case of PV and desmoglein I in the case of PF (Amagai et al., 1991). In pemphigus vulgaris, autoantibodies against PVA, a keratinocyte cell surface 130-kD glycoprotein, cause loss of cell-cell adhe-

sion. Amagai et al. (1991) used affinity-purified pemphigus vulgaris IgG to isolate cDNA, containing the entire coding sequence for PVA, from human keratinocyte expression libraries. Northern blot analysis indicated PV mRNA expression only in stratified squamous epithelia. The deduced amino acid sequence of PVA shows significant homology with members of the cadherin family of Ca^{2+} -dependent cell adhesion molecules, most markedly to desmoglein-1 (DSG1; 125670). Paraneoplastic pemphigus (PNP) is an autoimmune blistering disease that occurs in association with neoplasms such as non-Hodgkin lymphoma, chronic lymphatic leukemia, Castleman disease, thymomas, and poorly differentiated spindle cell sarcomas. Amagai et al. (1998) studied cell surface target antigens in paraneoplastic pemphigus. They focused on DSG3 and DSG1, the autoantigens of pemphigus vulgaris and pemphigus foliaceus, respectively. Using ELISA with baculovirus-expressed recombinant DSGs, they found that all 25 PNP sera tested were positive against DSG3 and that 16 of the 25 were positive against DSG1. All of 12 PNP sera tested immunoprecipitated DSG3. Removal of anti-DSG3 autoantibodies by immunoadsorption eliminated the ability of PNP sera to induce cutaneous

blisters in neonatal mice; anti-DSG3 autoantibodies purified from PNP sera induced cutaneous blisters in neonatal mice. Thus, DSG3 and DSG1 are the target antigens in PNP, and IgG autoantibodies against DSG3 in PNP sera play a pathogenic role in the loss of keratinocyte adhesion and blistering.

[4663] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4664] Amagai, M.; Klaus-Kovtun, V.; Stanley, J. R. : Autoantibodies against a novel epithelial cadherin in pemphigus vulgaris, a disease of cell adhesion. *Cell* 67: 869–877, 1991.
; and

[4665] Amagai, M.; Nishikawa, T.; Nousari, H. C.; Anhalt, G. J.; Hashimoto, T. : Antibodies against desmoglein 3 (pemphigus vulgaris antigen) are present in sera from patients with paraneoplas.

[4666] Further studies establishing the function and utilities of DSG3 are found in John Hopkins OMIM database record ID 169615, and in cited publications numbered 1122–751, 112 and 1124 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lipin 1 (LPIN1, Accession XM_041136) is another VGAM159

host target gene. LPIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN1 BINDING SITE, designated SEQ ID:2791, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4667] Another function of VGAM159 is therefore inhibition of Lipin 1 (LPIN1, Accession XM_041136), a gene which is involved in adipocyte differentiation (by similarity). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN1. The function of LPIN1 has been established by previous studies. Mice carrying mutations in the fatty liver dystrophy (fld) gene have features of human lipodystrophy (Reue et al., 2000). In the human, lipodystrophy is a heterogeneous group of disorders characterized by loss of body fat, fatty liver, hypertriglyceridemia, and insulin resistance. Through positional cloning, Peterfy et al. (2001) isolated the gene responsible for fatty liver dystrophy in mice and characterized 2 independent mu-

tant alleles of the fld gene. They designated the gene Lpin1 and named the novel nuclear protein which it encodes lipin. Through database searches, Peterfy et al. (2001) identified several mouse and human EST and genomic sequences with similarities to Lpin1. These included 2 Lpin1-related mouse genes (Lpin2 and Lpin3) and 3 human homologs (LPIN1, LPIN2 (OMIM Ref. No. 605519), and LPIN3 (OMIM Ref. No. 605520)). LPIN1 is identical to the KIAA0188 gene identified by Nagase et al. (1996). Consistent with the observed reduction of adipose tissue mass in fld mice, wildtype Lpin1 mRNA was expressed at high levels in adipose tissue and was induced during differentiation of 3T3-L1 preadipocytes. The results indicated that lipin is required for normal adipose tissue development, and provided a candidate gene for human lipodystrophy. Cao and Hegele (2002) sequenced the 21 exons of the LPIN1 gene in lipodystrophy patients who had no mutations in known lipodystrophy genes, and also in normal control subjects. They found no rare LPIN1 coding sequence variants that were exclusive to patients with lipodystrophy. However, they found 4 single nucleotide polymorphisms (SNPs).

[4668] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [4669] Reue, K.; Xu, P.; Wang, X.-P.; Slavin, B. G. : Adipose tissue deficiency, glucose intolerance, and increased atherosclerosis result from mutation in the mouse fatty liver dystrophy (fld) gene. J. Lipid Res. 41: 1067–1076, 2000. ; and
- [4670] Cao, H.; Hegele, R. A. : Identification of single-nucleotide polymorphisms in the human LPIN1 gene. J. Hum. Genet. 47: 370–372, 2002.
- [4671] Further studies establishing the function and utilities of LPIN1 are found in John Hopkins OMIM database record ID 605518, and in cited publications numbered 149 and 2639–1500 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transient Receptor Potential Cation Channel, Subfamily M, Member 1 (TRPM1, Accession NM_002420) is another VGAM159 host target gene. TRPM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM1 BINDING SITE, designated SEQ ID:928, to the nucleotide sequence of

VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4672] Another function of VGAM159 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 1 (TRPM1, Accession NM_002420), a gene which is suggested to mediate calcium entry. Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM1. The function of TRPM1 has been established by previous studies. Hunter et al. (1998) cloned the human melastatin cDNA from a retina cDNA library. The gene encodes a 1,533-amino acid polypeptide with homology to members of the transient receptor potential (Trp) family of calcium channels (see OMIM Ref. No. TRPC1; 602343). They also cloned the mouse melastatin genomic region and found that the promoter contains 4 consensus binding sites for the microphthalmia-associated transcription factor (MITF; 156845). One of these binding sites is an M box, a motif shared by the tyrosinase pigmentation genes (see OMIM Ref. No. TYRP1; 115501). Xu et al. (2001) found that TRPM1 mediates Ca^{2+} entry when expressed in HEK293 cells. They found that a short form of TRPM1 interacts directly with and suppresses the activity of full-

length TRPM1, possibly by inhibiting translocation of the full-length form to the plasma membrane. Using differential display analysis, Fang and Setaluri (2000) found TRPM1 among genes overexpressed in pigmented metastatic human melanoma cells treated with the differentiation inducer hexamethylene bisacetamide (HMBA). They found multiple short transcripts, from both the 5-prime and 3-prime ends of TRPM1, in melanocytes and pigmented metastatic melanoma cell lines. They found the full-length 5.4-kb transcript only in melanocytes. Northern blot and RT-PCR analysis demonstrated that HMBA treatment upregulates expression of the full-length and a 5-prime short form of TRPM1.

[4673] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4674] Hunter, J. J.; Shao, J.; Smutko, J. S.; Dussault, B. J.; Nagle, D. L.; Woolf, E. A.; Holmgren, L. M.; Moore, K. J.; Shyjan, A. W. : Chromosomal localization and genomic characterization of the mouse melastatin gene (*Mln1*). *Genomics* 54: 116-123, 1998. ; and

[4675] Xu, X. Z.; Moebius, F.; Gill, D. L.; Montell, C. : Regulation of melastatin, a TRP-related protein, through interaction

with a cytoplasmic isoform. Proc. Nat. Acad. Sci. 98: 10692–10697, 20.

[4676] Further studies establishing the function and utilities of TRPM1 are found in John Hopkins OMIM database record ID 603576, and in cited publications numbered 1221–1224 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEPP (Accession NM_007021) is another VGAM159 host target gene. DEPP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DEPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEPP BINDING SITE, designated SEQ ID:1347, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4677] Another function of VGAM159 is therefore inhibition of DEPP (Accession NM_007021). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEPP. FLJ20668 (Accession NM_017923) is another VGAM159 host target gene. FLJ20668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ20668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20668 BINDING SITE, designated SEQ ID:1764, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4678] Another function of VGAM159 is therefore inhibition of FLJ20668 (Accession NM_017923). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20668. KIAA1524 (Accession XM_056015) is another VGAM159 host target gene. KIAA1524 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1524 BINDING SITE, designated SEQ ID:2975, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4679] Another function of VGAM159 is therefore inhibition of KIAA1524 (Accession XM_056015). Accordingly, utilities

of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1524. PRO1617 (Accession NM_018587) is another VGAM159 host target gene. PRO1617 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1617 BINDING SITE, designated SEQ ID:1850, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4680] Another function of VGAM159 is therefore inhibition of PRO1617 (Accession NM_018587). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1617. SDF1 (Accession XM_165565) is another VGAM159 host target gene. SDF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDF1 BINDING SITE, designated SEQ ID:3502,

to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4681] Another function of VGAM159 is therefore inhibition of SDF1 (Accession XM_165565). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDF1. LOC130074 (Accession XM_072228) is another VGAM159 host target gene. LOC130074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:3043, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4682] Another function of VGAM159 is therefore inhibition of LOC130074 (Accession XM_072228). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC146952 (Accession XM_097138) is another VGAM159 host target gene. LOC146952 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC146952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146952 BINDING SITE, designated SEQ ID:3287, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4683] Another function of VGAM159 is therefore inhibition of LOC146952 (Accession XM_097138). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146952. LOC157983 (Accession XM_088433) is another VGAM159 host target gene. LOC157983 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157983, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157983 BINDING SITE, designated SEQ ID:3208, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4684] Another function of VGAM159 is therefore inhibition of LOC157983 (Accession XM_088433). Accordingly, utilities

of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157983. LOC203289 (Accession XM_114672) is another VGAM159 host target gene. LOC203289 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203289 BINDING SITE, designated SEQ ID:3463, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4685] Another function of VGAM159 is therefore inhibition of LOC203289 (Accession XM_114672). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203289. LOC256544 (Accession XM_171228) is another VGAM159 host target gene. LOC256544 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256544 BINDING SITE, designated SEQ ID:3695, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:494.

[4686] Another function of VGAM159 is therefore inhibition of LOC256544 (Accession XM_171228). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256544. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 160 (VGAM160) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4687] VGAM160 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM160 was detected is described hereinabove with reference to Figs. 1–8.

[4688] VGAM160 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM160 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4689] VGAM160 gene encodes a VGAM160 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM160 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM160 precursor RNA is designated SEQ ID:146, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:146 is located at position 81960 relative to the genome of Vaccinia Virus.

[4690] VGAM160 precursor RNA folds onto itself, forming VGAM160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4691] An enzyme complex designated DICER COMPLEX, `dices` the VGAM160 folded precursor RNA into VGAM160 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM160 RNA is designated SEQ ID:495, and is provided hereinbelow with reference to the sequence listing part.

[4692] VGAM160 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM160 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4693] VGAM160 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM160 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM160 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[4694] The complementary binding of VGAM160 RNA, herein designated VGAM RNA, to host target binding sites on VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM160 host target RNA into VGAM160 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4695] It is appreciated that VGAM160 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM160 host target genes. The mRNA of each one of this plurality of VGAM160 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM160 RNA, herein designated VGAM RNA, and which when bound by VGAM160 RNA causes inhibition of translation of respective one or more VGAM160 host target proteins.

[4696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM160 gene, herein designated VGAM GENE, on one or more VGAM160 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[4697] It is yet further appreciated that a function of VGAM160 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM160 correlate with, and may be deduced from, the identity of the host target genes which VGAM160 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4698] Nucleotide sequences of the VGAM160 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM160 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM160 are further described hereinbelow with reference to Table 1.

[4699] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM160 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM160 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4700] As mentioned hereinabove with reference to Fig. 1, a function of VGAM160 gene, herein designated VGAM is inhibition of expression of VGAM160 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM160 correlate with, and may be deduced from, the identity of the target genes which VGAM160 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4701] APPL (Accession NM_012096) is a VGAM160 host target gene. APPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPL BINDING SITE, designated SEQ ID:1405, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4702] A function of VGAM160 is therefore inhibition of APPL (Accession NM_012096). Accordingly, utilities of

VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPL. Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132) is another VGAM160 host target gene. F8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:708, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4703] Another function of VGAM160 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM_002869) is another VGAM160 host target gene. RAB6A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB6A, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6A BINDING SITE, designated SEQ ID:966, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4704] Another function of VGAM160 is therefore inhibition of RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM_002869), a gene which is involved in protein trafficking. Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6A. The function of RAB6A has been established by previous studies. The mammalian RAB proteins show striking similarities to the *S. cerevisiae* YPT1 and SEC4 proteins, Ras-related GTP-binding proteins involved in the regulation of secretion. Zahraoui et al. (1989) isolated cDNAs encoding RAB6 and several other human RAB proteins. See RAB5A (OMIM Ref. No. 179512). The predicted human RAB6 protein contains 208 amino acids. Northern blot analysis revealed that the RAB6 gene was expressed as a 3.6-kb mRNA in a human fibroblast cell line. By in situ hybridization, Rousseau-Merck et al. (1991) assigned the RAB6 gene to 2q14-q21.

- [4705] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [4706] Rousseau–Merck, M.–F.; Zahraoui, A.; Touchot, N.; Tavitian, A.; Berger, R. : Chromosome assignment of four RAS–related RAB genes. Hum. Genet. 86: 350–354, 1991. ; and
- [4707] Zahraoui, A.; Touchot, N.; Chardin, P.; Tavitian, A. : The human rab genes encode a family of GTP–binding proteins related to yeast YPT1 and SEC4 products involved in secretion. J. Biol.
- [4708] Further studies establishing the function and utilities of RAB6A are found in John Hopkins OMIM database record ID 179513, and in cited publications numbered 60 and 626 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ring Finger Protein 14 (RNF14, Accession NM_004290) is another VGAM160 host target gene. RNF14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF14 BINDING SITE,

designated SEQ ID:1097, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4709] Another function of VGAM160 is therefore inhibition of Ring Finger Protein 14 (RNF14, Accession NM_004290), a gene which associates with the androgen receptor (AR); functions as a transcriptional coactivator. Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF14. The function of RNF14 has been established by previous studies. The RING finger motif is a unique zinc-chelating domain involved in mediating protein-DNA and protein-protein interactions. Using the sequence of the partial cDNA clone HFB30 isolated by Ueki et al. (1998) to screen a human fetal brain cDNA library, Ueki et al. (1999) cloned the full-length cDNA, which encoded a novel ring finger protein, RNF14. The deduced 474-amino acid protein has a calculated molecular mass of approximately 53 kD. RT-PCR analysis revealed ubiquitous expression of RNF14 in a wide variety of human tissues. Kang et al. (1999) independently cloned RNF14, which they called ARA54 (androgen receptor-associated protein-54), by a yeast 2-hybrid screen of a prostate cDNA library.

Northern blot analysis detected a major 3-kb transcript, with highest expression in testis, followed by thymus, spleen, colon, prostate, and uterus. Low expression was detected in small intestine and blood leukocytes. The RNF14 transcript was also strongly detected in 2 other prostate cell lines. A second transcript of 2 kb was detected in testis only. Kang et al. (1999) demonstrated that RNF14 can function as a coactivator for androgen-dependent transcription on both wildtype and mutant androgen receptor (OMIM Ref. No. 313700). They also showed that in the presence of a certain amount of 17-beta-estradiol or hydroxyflutamide, the transcriptional activity of a specific AR mutant was significantly enhanced, whereas that of wildtype and another AR mutant was not. The authors suggested that both RNF14 and the positions of the AR mutation might contribute to the specificity of AR-mediated transactivation. Ueki et al. (1999) determined that the RNF14 gene contains 9 exons and spans approximately 20 kb of genomic DNA. By somatic cell hybrid and radiation hybrid analyses, Ueki et al. (1999) mapped the RNF14 gene to chromosome 5q23.3-q31.1.

[4710] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [4711] Ueki, N.; Seki, N.; Yano, K.; Masuho, Y.; Saito, T.; Muramatsu, M. : Isolation and characterization of a novel human gene (HFB30) which encodes a protein with a RING finger motif. *Biochim. Biophys. Acta* 232–236, 1999. ; and
- [4712] Kang, H.-Y.; Yeh, S.; Fujimoto, N.; Chang, C. : Cloning and characterization of human prostate coactivator ARA54, a novel protein that associates with the androgen receptor. *J. Biol. Chem.*
- [4713] Further studies establishing the function and utilities of RNF14 are found in John Hopkins OMIM database record ID 605675, and in cited publications numbered 1993–219 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SART2 (Accession NM_013352) is another VGAM160 host target gene. SART2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SART2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SART2 BINDING SITE, designated SEQ ID:1443, to the nucleotide sequence of VGAM160 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:495.

[4714] Another function of VGAM160 is therefore inhibition of SART2 (Accession NM_013352). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SART2. Early Endosome Antigen 1, 162kD (EEA1, Accession NM_003566) is another VGAM160 host target gene. EEA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EEA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EEA1 BINDING SITE, designated SEQ ID:1035, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4715] Another function of VGAM160 is therefore inhibition of Early Endosome Antigen 1, 162kD (EEA1, Accession NM_003566). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EEA1. FLJ10980 (Accession XM_035527) is another VGAM160 host target gene. FLJ10980 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

FLJ10980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10980 BINDING SITE, designated SEQ ID:2697, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4716] Another function of VGAM160 is therefore inhibition of FLJ10980 (Accession XM_035527). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10980. FLJ22794 (Accession XM_166220) is another VGAM160 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:3532, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4717] Another function of VGAM160 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of

VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. KIAA1328 (Accession XM_029429) is another VGAM160 host target gene. KIAA1328 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1328 BINDING SITE, designated SEQ ID:2601, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4718] Another function of VGAM160 is therefore inhibition of KIAA1328 (Accession XM_029429). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1328. PRO0902 (Accession NM_053057) is another VGAM160 host target gene. PRO0902 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0902

BINDING SITE, designated SEQ ID:2357, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4719] Another function of VGAM160 is therefore inhibition of PRO0902 (Accession NM_053057). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902. RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM_052949) is another VGAM160 host target gene. RAS-GRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASGRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:2348, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4720] Another function of VGAM160 is therefore inhibition of RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM_052949). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4. WW Domain

Binding Protein 4 (formin binding protein 21) (WBP4, Accession NM_007187) is another VGAM160 host target gene. WBP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WBP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBP4 BINDING SITE, designated SEQ ID:1363, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4721] Another function of VGAM160 is therefore inhibition of WW Domain Binding Protein 4 (formin binding protein 21) (WBP4, Accession NM_007187). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBP4. LOC116150 (Accession NM_138459) is another VGAM160 host target gene. LOC116150 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116150 BINDING SITE, designated SEQ ID:2443, to the nucleotide sequence

of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4722] Another function of VGAM160 is therefore inhibition of LOC116150 (Accession NM_138459). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116150. LOC164200 (Accession XM_092690) is another VGAM160 host target gene. LOC164200 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164200 BINDING SITE, designated SEQ ID:3248, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4723] Another function of VGAM160 is therefore inhibition of LOC164200 (Accession XM_092690). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164200. LOC51320 (Accession NM_016626) is another VGAM160 host target gene. LOC51320 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC51320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51320 BINDING SITE, designated SEQ ID:1702, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:495.

[4724] Another function of VGAM160 is therefore inhibition of LOC51320 (Accession NM_016626). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51320. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 161 (VGAM161) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4725] VGAM161 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM161 was detected is described hereinabove with reference to Figs. 1–8.

[4726] VGAM161 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4727] VGAM161 gene encodes a VGAM161 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM161 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM161 precursor RNA is designated SEQ ID:147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:147 is located at position 81428 relative to the genome of Vaccinia Virus.

[4728] VGAM161 precursor RNA folds onto itself, forming VGAM161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4729] An enzyme complex designated DICER COMPLEX, `dices` the VGAM161 folded precursor RNA into VGAM161 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM161 RNA is designated SEQ ID:496, and is provided hereinbelow with reference to the sequence listing part.

[4730] VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM161 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM161 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4731] VGAM161 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM161 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM161 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM161 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM161 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4732] The complementary binding of VGAM161 RNA, herein designated VGAM RNA, to host target binding sites on VGAM161 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM161 host tar-

get RNA into VGAM161 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4733] It is appreciated that VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM161 host target genes. The mRNA of each one of this plurality of VGAM161 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM161 RNA, herein designated VGAM RNA, and which when bound by VGAM161 RNA causes inhibition of translation of respective one or more VGAM161 host target proteins.

[4734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM161 gene, herein designated VGAM GENE, on one or more VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4735] It is yet further appreciated that a function of VGAM161 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM161 correlate with, and may be deduced from, the identity of the host target genes which VGAM161 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4736] Nucleotide sequences of the VGAM161 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM161 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM161 are further

described hereinbelow with reference to Table 1.

[4737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM161 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM161 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM161 gene, herein designated VGAM is inhibition of expression of VGAM161 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM161 correlate with, and may be deduced from, the identity of the target genes which VGAM161 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4739] Selectin P Ligand (SELPLG, Accession XM_006867) is a VGAM161 host target gene. SELPLG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELPLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELPLG BINDING

SITE, designated SEQ ID:2539, to the nucleotide sequence of VGAM161 RNA, herein designated VGAM RNA, also designated SEQ ID:496.

[4740] A function of VGAM161 is therefore inhibition of Selectin P Ligand (SELPLG, Accession XM_006867), a gene which binds to p-, e- and l-selectins, which mediates the tethering and rolling of neutrophils and t-lymphocytes on endothelial cells. Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELPLG. The function of SELPLG has been established by previous studies. Human granulocyte ehrlichiosis (HGE) is a febrile tick-bone illness caused by an intracellular bacterium remarkable for its tropism for professionally phagocytic neutrophils. Herron et al. (2000) demonstrated that monoclonal antibodies against the P-selectin binding domain of the leukocyte P-selectin glycoprotein ligand PSGL1 prevented HGE cell binding and infection, as did enzymatic digestion of PSGL1. Furthermore, simultaneous neoexpression in non-susceptible cells of complementary DNAs for both PSGL1 and its modifying alpha-(1,3) fucosyltransferase, Fuc-TVII (FUT7), allowed binding and infection by HGE. Thus, the HGE bacterium specifically bound to fucosylated leukocyte

PSGL1. Selection mimicry is likely central to the organism's unique ability to target and infect neutrophils. Selectin P ligand, or P-selectin glycoprotein ligand (OMIM Ref. No. PSGL-1), is the high affinity counter-receptor for P-selectin (SELP; 173610) on myeloid cells and stimulated T lymphocytes. As such, it plays a critical role in the tethering of these cells to activated platelets or endothelia expressing P-selectin. Veldman et al. (1995) cloned the SELPLG gene from a human placenta genomic DNA library and showed that a single intron of approximately 9 kb is located in the 5-prime untranslated region and that the complete coding region resides in exon 2. The organization of the gene, designated SELPLG, closely resembles that of CD43 (OMIM Ref. No. 182160) and the human platelet glycoprotein Gplb-alpha (OMIM Ref. No. 231200), both of which have an intron in the 5-prime-noncoding region, a long second exon containing the complete coding region, and TATA-less promoters.

[4741] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4742] Herron, M. J.; Nelson, C. M.; Larson, J.; Snapp, K. R.; Kansas, G. S.; Goodman, J. L. : Intracellular parasitism by

the human granulocytic ehrlichiosis bacterium through the P-selectin ligand, PSGL-1. Science 288: 1653-1656, 2000. ; and

[4743] Veldman, G. M.; Bean, K. M.; Cumming, D. A.; Eddy, R. L.; Sait, S. N. J.; Shows, T. B. : Genomic organization and chromosomal localization of the gene encoding human P-selectin glycop.

[4744] Further studies establishing the function and utilities of SELPLG are found in John Hopkins OMIM database record ID 600738, and in cited publications numbered 1718-1721 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ21144 (Accession NM_022774) is another VGAM161 host target gene. FLJ21144 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21144, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21144 BINDING SITE, designated SEQ ID:2007, to the nucleotide sequence of VGAM161 RNA, herein designated VGAM RNA, also designated SEQ ID:496.

[4745] Another function of VGAM161 is therefore inhibition of

FLJ21144 (Accession NM_022774). Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21144. KIAA0676 (Accession NM_015043) is another VGAM161 host target gene. KIAA0676 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:1603, to the nucleotide sequence of VGAM161 RNA, herein designated VGAM RNA, also designated SEQ ID:496.

[4746] Another function of VGAM161 is therefore inhibition of KIAA0676 (Accession NM_015043). Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676. KIAA1393 (Accession XM_050793) is another VGAM161 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:2935, to the nucleotide sequence of VGAM161 RNA, herein designated VGAM RNA, also designated SEQ ID:496.

[4747] Another function of VGAM161 is therefore inhibition of KIAA1393 (Accession XM_050793). Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. Ubinuclein 1 (UBN1, Accession NM_016936) is another VGAM161 host target gene. UBN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBN1 BINDING SITE, designated SEQ ID:1716, to the nucleotide sequence of VGAM161 RNA, herein designated VGAM RNA, also designated SEQ ID:496.

[4748] Another function of VGAM161 is therefore inhibition of Ubinuclein 1 (UBN1, Accession NM_016936). Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBN1. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 162 (VGAM162) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4749] VGAM162 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM162 was detected is described hereinabove with reference to Figs. 1–8.

[4750] VGAM162 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM162 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4751] VGAM162 gene encodes a VGAM162 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM162 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM162 precursor RNA is designated SEQ ID:148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:148 is

located at position 81204 relative to the genome of Vac-
cinia Virus.

[4752] VGAM162 precursor RNA folds onto itself, forming VGAM162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4753] An enzyme complex designated DICER COMPLEX, `dices` the VGAM162 folded precursor RNA into VGAM162 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM162 RNA is designated SEQ ID:497, and is provided hereinbelow with reference to the sequence listing part.

[4754] VGAM162 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM162 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM162 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[4755] VGAM162 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM162 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM162 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM162 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM162 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[4756] The complementary binding of VGAM162 RNA, herein designated VGAM RNA, to host target binding sites on VGAM162 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM162 host target RNA into VGAM162 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4757] It is appreciated that VGAM162 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM162 host target genes. The mRNA of each one of this plurality of VGAM162 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM162 RNA, herein designated VGAM RNA, and which when bound by VGAM162 RNA causes inhibition of translation of respective one or more VGAM162

host target proteins.

[4758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM162 gene, herein designated VGAM GENE, on one or more VGAM162 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4759] It is yet further appreciated that a function of VGAM162 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM162 correlate with, and may be deduced from, the identity of the host target genes which VGAM162 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4760] Nucleotide sequences of the VGAM162 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM162 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM162 are further described hereinbelow with reference to Table 1.

[4761] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM162 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM162 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4762] As mentioned hereinabove with reference to Fig. 1, a function of VGAM162 gene, herein designated VGAM is inhibition of expression of VGAM162 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM162 correlate with, and may be deduced from, the identity of the target genes which VGAM162 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4763] Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM_001407) is a VGAM162 host target gene. CELSR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR3 BINDING SITE, designated SEQ ID:824, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4764] A function of VGAM162 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM_001407), a gene which interacts in a homophilic manner in connecting cells. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR3. The function of CELSR3 has been established by previous studies. The do-

main that characterizes epidermal growth factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF-like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor-ligand interactions. Proteins with EGF-like domains often consist of more than 1,000 amino acids, have multiple copies of the EGF-like domain, and contain additional domains known to be involved in specific protein-protein interactions. To identify proteins containing EGF-like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF-like motif. They identified several partial cDNAs encoding novel proteins with EGF-like domains, such as EGFL1, which they named MEGF2. Nakayama et al. (1998) isolated a rat cDNA containing the complete Megf2 coding sequence. The predicted Megf2 protein has a signal sequence, 8 cadherin motifs (see OMIM Ref. No. 603006), 6 EGF-like domains, 2 laminin G domains (see OMIM Ref. No. 601033), 7 transmembrane domains, and a cytoplasmic proline-rich sequence. Megf2 appears to have a domain structure identical to that of human MEGF3 (OMIM Ref. No. 604265), whose partial cDNA was also

isolated by the authors. Northern blot analysis detected Megf2 expression in several regions of rat brain.

[4765] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4766] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high-molecular-weight proteins with multiple EGF-like motifs by motif-trap screening. *Genomics* 51: 27-34, 1998. ; and

[4767] Wu, Q.; Maniatis, T. : Large exons encoding multiple ectodomains are a characteristic feature of protocadherin genes. *Proc. Nat. Acad. Sci.* 97: 3124-3129, 2000.

[4768] Further studies establishing the function and utilities of CELSR3 are found in John Hopkins OMIM database record ID 604264, and in cited publications numbered 1672-1673 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Protein-coupled Receptor 85 (GPR85, Accession NM_018970) is another VGAM162 host target gene. GPR85 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR85, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of GPR85 BINDING SITE, designated SEQ ID:1868, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4769] Another function of VGAM162 is therefore inhibition of G Protein-coupled Receptor 85 (GPR85, Accession NM_018970). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR85. Integrin, Alpha V (vitronectin receptor, alpha polypeptide, antigen CD51) (ITGAV, Accession NM_002210) is another VGAM162 host target gene. ITGAV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGAV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAV BINDING SITE, designated SEQ ID:908, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4770] Another function of VGAM162 is therefore inhibition of Integrin, Alpha V (vitronectin receptor, alpha polypeptide, antigen CD51) (ITGAV, Accession NM_002210), a gene which is a member of the integrin family of cell-surface

proteins. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAV. The function of ITGAV has been established by previous studies. A major surface antigen family on human leukocytes includes complement receptor type 3 (CR3A; also called integrin alpha-M, Mac1 or Mo1), lymphocyte function-associated antigen type 1 (LFA-1; 153370), and p150,95 (Leu M5; 151510). These antigens share a common beta chain (OMIM Ref. No. 116920) of 94 kD, linked noncovalently to 1 of 3 alpha chains distinctive to each. They promote adhesion of granulocytes to each other and to endothelial cell monolayers. The apparent molecular weight of the Mo1 alpha chain is 155 to 165 kD, that of the LFA1 alpha subunit is 180 kD, and that of the Leu M5 subunit is 130 to 150 kD. Pierce et al. (1986) purified human Mo1 to homogeneity from normal granulocytes by affinity chromatography and high performance liquid chromatography (HPLC) and determined the N-terminal amino acid sequence of its alpha subunit. The obtained sequence was identical, except for 2 conservative substitutions, to that of the alpha subunit of Mac1 antigen (Springer et al., 1985). Furthermore, Pierce et al. (1986) found that the N-terminal amino acid

sequence of the alpha subunit of Mo1 was homologous to the alpha subunit of IIb/IIIa, a glycoprotein that serves similar adhesive functions on platelets and is deficient or defective in Glanzmann thrombasthenia (OMIM Ref. No. 273800). Patients with a history of recurrent bacterial infections and an inherited deficiency of all 3 leukocyte membrane surface antigens are thought to have reduced or absent synthesis of the common beta subunit of the antigen family; see 116920. Inflammation plays an essential role in the initiation and progression of atherosclerosis. Simon et al. (2000) presented evidence that it also has a role in vascular repair after mechanical arterial injury (i.e., percutaneous transluminal coronary angioplasty, or PTCA). In animal models of vascular injury, leukocytes are recruited as a precursor to intimal thickening. Markers of leukocyte activation, in particular, increased expression of Mac1, which is responsible for firm leukocyte adhesion to platelets and fibrinogen on denuded vessels, predict restenosis after PTCA. To determine whether Mac1-mediated leukocyte recruitment is causally related to neointimal formation, Simon et al. (2000) subjected Mac1 knockout mice to a mechanical carotid artery dilation and complete endothelial denudation. They found

that the selective absence of Mac1 impaired transplatelet leukocyte migration into the vessel wall, reducing leukocyte accumulation. Diminished medial leukocyte accumulation was accompanied by markedly reduced neointimal thickening after vascular injury. These data established a role for inflammation in neointimal thickening and suggested that leukocyte recruitment to mechanically injured arteries may prevent restenosis

[4771] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4772] Pierce, M. W.; Remold-O'Donnell, E.; Todd, R. F., III; Arnaout, M. A. : N-terminal sequence of human leukocyte glycoprotein Mo1: conservation across species and homology to platelet IIb/IIIa. *Biochim. Biophys. Acta* 874: 368-371, 1986. ; and

[4774] Further studies establishing the function and utilities of ITGAV are found in John Hopkins OMIM database record ID 193210, and in cited publications numbered 101-102,

759, 760–761, 10 and 2998–2999 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM_014268) is another VGAM162 host target gene. MAPRE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE2 BINDING SITE, designated SEQ ID:1487, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4775] Another function of VGAM162 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM_014268), a gene which The functional inactivation of the APC gene product is a key event in colorectal tumorigenesis. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE2. The function of MAPRE2 has been established by previous studies. EB1 family proteins (e.g., MAPRE1; 603108) interact with cytoplasmic microtubules in interphase cells, with

mitotic spindles, and with the adenomatous polyposis coli (APC; 175100) tumor suppressor gene. The functional inactivation of the APC gene product is a key event in colorectal tumorigenesis. By differential mRNA display of resting and activated T cells, followed by 5-prime RACE, Renner et al. (1997) isolated a cDNA encoding MAPRE2, which they termed RP1. The deduced 327-amino acid protein has significant homology with EB1 family proteins. Northern blot analysis detected a 2.6-kb transcript in T cells activated by 2 signals (i.e., cell surface antigen(s) and/or cytokine) and also in lymphocyte tumor cell lines. Immunoprecipitation analysis indicated that RP1 associates with full-length but not C terminus-deleted APC. Renner et al. (1997) concluded that RP1 may be an immediate-early T-cell regulatory gene. Using immunoprecipitation analysis, Juwana et al. (1999) showed that the N terminus of RP1 interacted with monomeric or polymerized tubulin in fibrosarcoma cell lines. Immunofluorescence microscopy demonstrated that RP1 is localized in the plus ends of microtubule networks in the presence or absence of APC. By radiation hybrid and sequence analyses, Su and Qi (2001) mapped the MAPRE2 gene to 18q12. By FISH, Wadle et al. (2001) assigned the gene to 18q21.

- [4776] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [4777] Juwana, J.-P.; Henderikx, P.; Mischo, A.; Wadle, A.; Fadle, N.; Gerlach, K.; Arends, J. W.; Hoogenboom, H.; Pfreundschuh, M.; Renner, C. : EB/RP gene family encodes tubulin binding proteins. *Int. J. Cancer* 81: 275–284, 1999. ; and

- [4779] Further studies establishing the function and utilities of MAPRE2 are found in John Hopkins OMIM database record ID 605789, and in cited publications numbered 178–17 and 1937 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paired Box Gene 6 (aniridia, keratitis) (PAX6, Accession NM_001604) is another VGAM162 host target gene. PAX6 BINDING SITE1 and PAX6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of PAX6 BINDING SITE1 and PAX6 BINDING SITE2, designated SEQ ID:837 and SEQ ID:726 respectively, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4780] Another function of VGAM162 is therefore inhibition of Paired Box Gene 6 (aniridia, keratitis) (PAX6, Accession NM_001604), a gene which involves in oculogenesis. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX6. The function of PAX6 has been established by previous studies. PAX6 is a member of the paired box gene family and encodes a transcriptional regulator involved in oculogenesis, pancreatic, pituitary and central nervous system development. Hanson and Van Heyningen (1995) reviewed the work on PAX6 in man, mouse, and *Drosophila*. A chronology was provided, beginning with identification of the 'paired' gene as a key regulator of segmentation in *Drosophila* in 1980 to the discovery by Halder et al. (1995) that ectopic expression of *Drosophila* Pax6 induces ectopic eye development. Wawersik and Maas (2000) reviewed the role of Pax6 and other genes in vertebrate and fly oculogenesis. Animal

model experiments lend further support to the function of PAX6. Lyon (1988) suggested that 'small eye' (Sey) in the mouse, which is on chromosome 2, may be homologous to aniridia type II (OMIM Ref. No. 106210) inasmuch as there is a region of conserved homology of synteny between human 11p and mouse chromosome 2. This suggestion was corroborated by van der Meer-de Jong et al. (1990) who found through interspecies backcrosses for linkage mapping that the Sey gene lies between Fshb and Cas-1. In the human, AN2 lies between the 2 cognate genes, FSHB and CAT. Glaser et al. (1990) studied the Sey mutation by localizing in an interspecies backcross between *Mus musculus*/domesticus and *Mus spretus*, the region on mouse chromosome 2 carrying 9 evolutionarily conserved DNA clones from proximal human 11p. In Dickie's small eye, they found deletion of 3 clones that encompass the aniridia (AN2) and Wilms tumor susceptibility genes in man. Unlike their human counterparts, the heterozygous Dickie's small eye mice do not develop nephroblastomas. The homology of Sey and AN2 was established by the cloning of the AN2 gene in the human and its homolog in the mouse, and the demonstration of mutations in 3 independent Sey alleles (Hill et al., 1991).

The mutations would predictably disrupt the function of the gene, which belongs to the Pax multigene family. This family of developmental genes was first described in *Drosophila*. A Pax gene referred to as Pax6 is identical to the mouse homolog of the candidate aniridia gene. Matsuo et al. (1993) found an internal deletion of about 600 bp in the Pax6 gene in rats homozygous for the small eye mutation. Deletion was due to a single base insertion that generated an abnormal 5-prime donor splice site. They showed that anterior midbrain crest cells in the homozygous embryos reached the eye rudiments but did not migrate any further to the nasal rudiments, suggesting that the Pax6 gene is involved in conducting migration of neural crest cells from the anterior midbrain.

[4781] It is appreciated that the abovementioned animal model for PAX6 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4782] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4783] Wawersik, S.; Maas, R. L. : Vertebrate eye development as modeled in *Drosophila*. *Hum. Molec. Genet.* 9: 917-925,

- [4785] Further studies establishing the function and utilities of PAX6 are found in John Hopkins OMIM database record ID 607108, and in cited publications numbered 1271, 2833, 1856, 2834, 2936-2939, 1282-1284, 2686-1286, 2940, 2941, 2942-2943, 1289-1291, 2944, 2945-2946, 1419, 2835, 2947-2949, 1279, 2950, 2951-1249, 2479, 2952, 2955, 2953-125 and 1 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 31 (copper transporters), Member 1 (SLC31A1, Accession NM_001859) is another VGAM162 host target gene. SLC31A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC31A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC31A1 BINDING SITE, designated SEQ ID:864, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4786] Another function of VGAM162 is therefore inhibition of Solute Carrier Family 31 (copper transporters), Member 1 (SLC31A1, Accession NM_001859), a gene which is involved in high-affinity copper uptake. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC31A1. The function of SLC31A1 has been established by previous studies. Moller et al. (2000) found that cells expressing CTR1 but not those expressing CTR2 showed a dramatic hyperaccumulation of radioactive copper, comparable to that seen in fibroblasts from Menkes disease patients. However, in contrast to the Menkes syndrome fibroblasts, the CTR1-expressing fibroblasts had an efflux rate similar to normal fibroblasts. Animal model experiments lend further support to the function of SLC31A1. To test the hypothesis that CTR1 is required for copper delivery to mammalian cells, Kuo et al. (2001) inactivated the Ctr1 gene in mice by targeted mutagenesis. They observed early embryonic lethality in homozygous mutant embryos and a deficiency in copper uptake in the brains of heterozygous animals. A study of the spatial and temporal expression pattern of Ctr1 during mouse development and adulthood further showed that Ctr1 is ubiqui-

tously transcribed with highest expression observed in the specialized epithelia of the choroid plexus and renal tubules and in connective tissues of the eye, ovary, and testis. Similarly, Lee et al. (2001) showed that the mouse Ctr1 gene encodes a component of the copper transport machinery and that mice heterozygous for Ctr1 exhibit tissue-specific defects in copper accumulation and in the activities of copper-dependent enzymes. Mice completely deficient for Ctr1 exhibited profound growth and developmental defects and died in utero in midgestation

[4787] It is appreciated that the abovementioned animal model for SLC31A1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4788] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4789] Lee, J.; Prohaska, J. R.; Thiele, D. J. : Essential role for mammalian copper transporter Ctr1 in copper homeostasis and embryonic development. Proc. Nat. Acad. Sci. 98: 6842–6847, 2001. ; and

[4790] Moller, L. B.; Petersen, C.; Lund, C.; Horn, N. : Characterization of the hCTR1 gene: genomic organization, func–

tional expression, and identification of a highly homologous processed gen.

[4791] Further studies establishing the function and utilities of SLC31A1 are found in John Hopkins OMIM database record ID 603085, and in cited publications numbered 241–247 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615) is another VGAM162 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:1043, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4792] Another function of VGAM162 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Ac-

cordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 has been established by previous studies. By searching an EST database for sequences related to the pNBC variant of NBC1 (OMIM Ref. No. SLC4A4), Pushkin et al. (1999) identified ESTs encoding SLC4A7, which they called NBC3. They isolated human muscle cDNAs representing a full-length NBC3 coding sequence. The predicted 1,214-amino acid muscle NBC3 variant, which the authors referred to as mNBC3, contains 12 putative transmembrane domains, with cytoplasmic N and C termini. mNBC3 has 1 putative stilbene-binding motif, numerous potential intracellular phosphorylation sites, potential sites for myristylation and amidation, and potential N-linked glycosylation sites in the exofacial loops between transmembrane domains 1 and 2, and 5 and 6. mNBC3 shares 78% amino acid sequence homology with the NBC2 variant (Ishibashi et al., 1998) of SLC4A7, 46% homology with the kNBC variant of NBC1, 39% homology with the pNBC variant of NBC1, and 29% homology with AE3 (SLC4A3; 106195). Expression of mNBC3 in *Xenopus* oocytes demonstrated that it is a stilbene-insensitive

5-(N-ethyl-N-isopropyl)-amiloride (EIPA)-inhibitable NBC. The SLC4A7 gene spans approximately 80 kb and contains 25 exons. Northern blot analysis of a number of human tissues detected an approximately 7.8-kb mNBC3 transcript only in skeletal muscle and heart. Burnham et al. (2000) stated that the NBC2 (Ishibashi et al., 1998) and mNBC3 (Pushkin et al., 1999) cDNAs share several kb of identical sequence. Although the deduced protein sequences differ in their N and C termini and each protein contains an interior region not present in the other, the corresponding blocks share more than 99% identity. Thus, Burnham et al. (2000) suggested that NBC2 and mNBC3 are encoded by the same gene. Burnham et al. (2000) isolated a human melanoma cell cDNA that encodes a protein containing elements previously thought to be characteristic of each of the variants NBC2 and mNBC3. Northern blot analysis of several human tissues using a probe specific to NBC2 detected expression mainly in lymph node and brain. Northern blot analysis using a probe specific to mNBC3 showed highest expression in skeletal muscle and heart and lower expression in lymph node, whole brain, adrenal gland, trachea, thyroid, stomach, pancreas, kidney, liver, lung, and placenta. Burnham et al. (2000) con-

cluded that the melanoma cell, NBC2, and mNBC3 cDNAs represent 3 alternate transcripts of the SLC4A7 gene, which they called NBC2

[4793] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4794] Pushkin, A.; Abuladze, N.; Lee, I.; Newman, D.; Hwang, J.; Kurtz, I. : Mapping of the human NBC3 (SLC4A7) gene to chromosome 3p22. Genomics 57: 321–322, 1999. Note: Correction: Genomics 58: 216 and 321–322, 1999. ; and

[4796] Further studies establishing the function and utilities of SLC4A7 are found in John Hopkins OMIM database record ID 603353, and in cited publications numbered 248–25 and 1820 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 22 (KOX 15) (ZNF22, Accession XM_166153) is another VGAM162 host target gene. ZNF22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF22 BINDING SITE, designated SEQ ID:3527, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4797] Another function of VGAM162 is therefore inhibition of Zinc Finger Protein 22 (KOX 15) (ZNF22, Accession XM_166153). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF22. ARGBP2 (Accession NM_003603) is another VGAM162 host target gene. ARGBP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARGBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARGBP2 BINDING SITE, designated SEQ ID:1041, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4798] Another function of VGAM162 is therefore inhibition of ARGBP2 (Accession NM_003603). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ARGBP2. Chromosome 20 Open Reading Frame 7 (C20orf7, Accession NM_024120) is another VGAM162 host target gene. C20orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf7 BINDING SITE, designated SEQ ID:2056, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4799] Another function of VGAM162 is therefore inhibition of Chromosome 20 Open Reading Frame 7 (C20orf7, Accession NM_024120). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf7. FLJ12704 (Accession NM_024998) is another VGAM162 host target gene. FLJ12704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ12704 BINDING SITE, designated SEQ ID:2125, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4800] Another function of VGAM162 is therefore inhibition of FLJ12704 (Accession NM_024998). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704. FLJ13194 (Accession NM_025146) is another VGAM162 host target gene. FLJ13194 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13194 BINDING SITE, designated SEQ ID:2141, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4801] Another function of VGAM162 is therefore inhibition of FLJ13194 (Accession NM_025146). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13194. FLJ20005 (Accession NM_017617) is another VGAM162

host target gene. FLJ20005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20005 BINDING SITE, designated SEQ ID:1731, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4802] Another function of VGAM162 is therefore inhibition of FLJ20005 (Accession NM_017617). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20005. FLJ20417 (Accession NM_017810) is another VGAM162 host target gene. FLJ20417 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20417 BINDING SITE, designated SEQ ID:1754, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4803] Another function of VGAM162 is therefore inhibition of FLJ20417 (Accession NM_017810). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20417. KIAA0712 (Accession NM_014715) is another VGAM162 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:1529, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4804] Another function of VGAM162 is therefore inhibition of KIAA0712 (Accession NM_014715). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0712. KIAA0750 (Accession NM_014632) is another VGAM162 host target gene. KIAA0750 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0750, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0750 BINDING SITE, designated SEQ ID:1510, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4805] Another function of VGAM162 is therefore inhibition of KIAA0750 (Accession NM_014632). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0750. KIAA1128 (Accession XM_043596) is another VGAM162 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:2821, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4806] Another function of VGAM162 is therefore inhibition of KIAA1128 (Accession XM_043596). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1128. KIAA1281 (Accession XM_114432) is another VGAM162 host target gene. KIAA1281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1281 BINDING SITE, designated SEQ ID:3461, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4807] Another function of VGAM162 is therefore inhibition of KIAA1281 (Accession XM_114432). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1281. KIAA1841 (Accession XM_087056) is another VGAM162 host target gene. KIAA1841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1841 BINDING SITE, designated SEQ ID:3151, to the nucleotide sequence of VGAM162 RNA, herein designated

VGAM RNA, also designated SEQ ID:497.

[4808] Another function of VGAM162 is therefore inhibition of KIAA1841 (Accession XM_087056). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1841. Rab11-FIP2 (Accession NM_014904) is another VGAM162 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:1580, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4809] Another function of VGAM162 is therefore inhibition of Rab11-FIP2 (Accession NM_014904). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. RABEX5 (Accession NM_014504) is another VGAM162 host target gene. RABEX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RABEX5, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABEX5 BINDING SITE, designated SEQ ID:1504, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4810] Another function of VGAM162 is therefore inhibition of RABEX5 (Accession NM_014504). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABEX5. Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM_013257) is another VGAM162 host target gene. SGKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGKL BINDING SITE, designated SEQ ID:1438, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4811] Another function of VGAM162 is therefore inhibition of Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM_013257). Accordingly, utilities of VGAM162 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with SGKL. Synaptotagmin-like 3 (SYTL3, Accession XM_087804) is another VGAM162 host target gene. SYTL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYTL3 BINDING SITE, designated SEQ ID:3183, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4812] Another function of VGAM162 is therefore inhibition of Synaptotagmin-like 3 (SYTL3, Accession XM_087804). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL3. TTY7 (Accession NM_031926) is another VGAM162 host target gene. TTY7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TTY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY7 BIND-

ING SITE, designated SEQ ID:2220, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4813] Another function of VGAM162 is therefore inhibition of TTY7 (Accession NM_031926). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY7. LOC113612 (Accession XM_054492) is another VGAM162 host target gene. LOC113612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113612 BINDING SITE, designated SEQ ID:2968, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4814] Another function of VGAM162 is therefore inhibition of LOC113612 (Accession XM_054492). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113612. LOC121457 (Accession XM_058563) is another VGAM162 host target gene. LOC121457 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC121457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121457 BINDING SITE, designated SEQ ID:2993, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4815] Another function of VGAM162 is therefore inhibition of LOC121457 (Accession XM_058563). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121457. LOC133491 (Accession XM_059655) is another VGAM162 host target gene. LOC133491 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133491 BINDING SITE, designated SEQ ID:3015, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4816] Another function of VGAM162 is therefore inhibition of

LOC133491 (Accession XM_059655). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133491. LOC143282 (Accession XM_084481) is another VGAM162 host target gene. LOC143282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143282 BINDING SITE, designated SEQ ID:3054, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4817] Another function of VGAM162 is therefore inhibition of LOC143282 (Accession XM_084481). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143282. LOC143524 (Accession XM_084559) is another VGAM162 host target gene. LOC143524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC143524 BINDING SITE, designated SEQ ID:3059, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4818] Another function of VGAM162 is therefore inhibition of LOC143524 (Accession XM_084559). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143524. LOC144559 (Accession XM_084896) is another VGAM162 host target gene. LOC144559 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144559 BINDING SITE, designated SEQ ID:3066, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4819] Another function of VGAM162 is therefore inhibition of LOC144559 (Accession XM_084896). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144559. LOC153222 (Accession XM_087631) is an-

other VGAM162 host target gene. LOC153222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153222 BINDING SITE, designated SEQ ID:3180, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4820] Another function of VGAM162 is therefore inhibition of LOC153222 (Accession XM_087631). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153222. LOC219623 (Accession XM_166143) is another VGAM162 host target gene. LOC219623 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219623 BINDING SITE, designated SEQ ID:3525, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4821] Another function of VGAM162 is therefore inhibition of LOC219623 (Accession XM_166143). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219623. LOC219918 (Accession XM_166197) is another VGAM162 host target gene. LOC219918 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219918 BINDING SITE, designated SEQ ID:3530, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4822] Another function of VGAM162 is therefore inhibition of LOC219918 (Accession XM_166197). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219918. LOC220071 (Accession XM_167848) is another VGAM162 host target gene. LOC220071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220071, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220071 BINDING SITE, designated SEQ ID:3602, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4823] Another function of VGAM162 is therefore inhibition of LOC220071 (Accession XM_167848). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220071. LOC254431 (Accession XM_173024) is another VGAM162 host target gene. LOC254431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254431 BINDING SITE, designated SEQ ID:3717, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4824] Another function of VGAM162 is therefore inhibition of LOC254431 (Accession XM_173024). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254431. LOC255515 (Accession XM_171185) is another VGAM162 host target gene. LOC255515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255515 BINDING SITE, designated SEQ ID:3688, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4825] Another function of VGAM162 is therefore inhibition of LOC255515 (Accession XM_171185). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255515. LOC56959 (Accession XM_088578) is another VGAM162 host target gene. LOC56959 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56959 BINDING SITE, designated SEQ ID:3219, to the nucleotide sequence of VGAM162 RNA, herein designated

VGAM RNA, also designated SEQ ID:497.

[4826] Another function of VGAM162 is therefore inhibition of LOC56959 (Accession XM_088578). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56959. LOC90906 (Accession XM_034809) is another VGAM162 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:2685, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:497.

[4827] Another function of VGAM162 is therefore inhibition of LOC90906 (Accession XM_034809). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 163 (VGAM163) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4828] VGAM163 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM163 was detected is described hereinabove with reference to Figs. 1–8.

[4829] VGAM163 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM163 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4830] VGAM163 gene encodes a VGAM163 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM163 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM163 precursor RNA is designated SEQ ID:149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:149 is located at position 83968 relative to the genome of Vaccinia Virus.

[4831] VGAM163 precursor RNA folds onto itself, forming

VGAM163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4832] An enzyme complex designated DICER COMPLEX, `dices` the VGAM163 folded precursor RNA into VGAM163 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM163 RNA is designated SEQ ID:498, and is provided hereinbelow with reference to the sequence listing part.

[4833] VGAM163 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM163 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM163 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4834] VGAM163 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM163 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM163 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM163 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM163 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4835] The complementary binding of VGAM163 RNA, herein designated VGAM RNA, to host target binding sites on VGAM163 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM163 host target RNA into VGAM163 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4836] It is appreciated that VGAM163 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM163 host target genes. The mRNA of each one of this plurality of VGAM163 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM163 RNA, herein designated VGAM RNA, and which when bound by VGAM163 RNA causes inhibition of translation of respective one or more VGAM163 host target proteins.

[4837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM163 gene, herein designated VGAM GENE, on one or more VGAM163 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4838] It is yet further appreciated that a function of VGAM163 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM163 correlate with, and may be deduced from, the identity of the host target genes which VGAM163 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[4839] Nucleotide sequences of the VGAM163 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM163 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM163 are further described hereinbelow with reference to Table 1.

[4840] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM163 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM163 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4841] As mentioned hereinabove with reference to Fig. 1, a function of VGAM163 gene, herein designated VGAM is inhibition of expression of VGAM163 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM163 correlate with, and may be deduced from, the identity of the target genes which VGAM163 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[4842] Enamelin (ENAM, Accession NM_031889) is a VGAM163 host target gene. ENAM BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ENAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAM BINDING SITE, designated SEQ ID:2216, to the nucleotide sequence of VGAM163 RNA, herein designated VGAM RNA, also designated SEQ ID:498.

[4843] A function of VGAM163 is therefore inhibition of Enamelin (ENAM, Accession NM_031889). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAM. Ephrin-A5 (EFNA5, Accession NM_001962) is another VGAM163 host target gene. EFNA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNA5 BINDING SITE, designated SEQ ID:876, to the nucleotide sequence of

VGAM163 RNA, herein designated VGAM RNA, also designated SEQ ID:498.

[4844] Another function of VGAM163 is therefore inhibition of Ephrin-A5 (EFNA5, Accession NM_001962). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA5. LOC159199 (Accession XM_089441) is another VGAM163 host target gene. LOC159199 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:3236, to the nucleotide sequence of VGAM163 RNA, herein designated VGAM RNA, also designated SEQ ID:498.

[4845] Another function of VGAM163 is therefore inhibition of LOC159199 (Accession XM_089441). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159199. LOC90321 (Accession XM_030896) is another VGAM163 host target gene. LOC90321 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC90321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90321 BINDING SITE, designated SEQ ID:2630, to the nucleotide sequence of VGAM163 RNA, herein designated VGAM RNA, also designated SEQ ID:498.

[4846] Another function of VGAM163 is therefore inhibition of LOC90321 (Accession XM_030896). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90321. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 164 (VGAM164) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4847] VGAM164 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM164 was detected is described hereinabove with reference to Figs. 1–8.

[4848] VGAM164 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4849] VGAM164 gene encodes a VGAM164 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM164 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM164 precursor RNA is designated SEQ ID:150, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:150 is located at position 84375 relative to the genome of Vaccinia Virus.

[4850] VGAM164 precursor RNA folds onto itself, forming VGAM164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4851] An enzyme complex designated DICER COMPLEX, `dices` the VGAM164 folded precursor RNA into VGAM164 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM164 RNA is designated SEQ ID:499, and is provided hereinbelow with reference to the sequence listing part.

[4852] VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM164 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4853] VGAM164 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM164 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM164 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4854] The complementary binding of VGAM164 RNA, herein designated VGAM RNA, to host target binding sites on VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM164 host tar-

get RNA into VGAM164 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4855] It is appreciated that VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM164 host target genes. The mRNA of each one of this plurality of VGAM164 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM164 RNA, herein designated VGAM RNA, and which when bound by VGAM164 RNA causes inhibition of translation of respective one or more VGAM164 host target proteins.

[4856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM164 gene, herein designated VGAM GENE, on one or more VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4857] It is yet further appreciated that a function of VGAM164 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM164 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM164 correlate with, and may be deduced from, the identity of the host target genes which VGAM164 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4858] Nucleotide sequences of the VGAM164 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM164 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM164 are further

described hereinbelow with reference to Table 1.

[4859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM164 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM164 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4860] As mentioned hereinabove with reference to Fig. 1, a function of VGAM164 gene, herein designated VGAM is inhibition of expression of VGAM164 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM164 correlate with, and may be deduced from, the identity of the target genes which VGAM164 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4861] V-Ki-ras2 Kirsten Rat Sarcoma 2 Viral Oncogene Homolog (KRAS2, Accession NM_004985) is a VGAM164 host target gene. KRAS2 BINDING SITE1 and KRAS2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KRAS2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of KRAS2 BINDING SITE1 and KRAS2 BINDING SITE2, designated SEQ ID:1166 and SEQ ID:2331 respectively, to the nucleotide sequence of VGAM164 RNA, herein designated VGAM RNA, also designated SEQ ID:499.

[4862] A function of VGAM164 is therefore inhibition of V-Ki-ras2 Kirsten Rat Sarcoma 2 Viral Oncogene Homolog (KRAS2, Accession NM_004985), a gene which ras proteins bind gdp/gtp and possess intrinsic gtpase activity. Accordingly, utilities of VGAM164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRAS2. The function of KRAS2 has been established by previous studies. See 190020. KRAS2 is on chromosome 12; KRAS1P, a pseudogene, is on chromosome 6. Weinberg (1982) suggested that the then-recognized cellular oncogenes could be assigned to a small number of gene families; e.g., the ras family with at least 4 distinct oncogenes, and the src-yes-mos family with another 3. The probable role of at least 2 oncogenes in normal differentiation is indicated by the findings of transcription of KRAS and the McDonough strain of feline sarcoma virus (FMS) during mouse development (Muller et al., 1983). Furthermore, the differences in transcription in

different tissues suggested a specific role for each: FMS was expressed in extraembryonic structures or in transport in these tissues, whereas KRAS was expressed ubiquitously. KRAS, with a length of more than 30 kb, is much larger than HRAS (OMIM Ref. No. 190020) or NRAS (OMIM Ref. No. 164790). Although the 3 ras genes, HRAS, KRAS, and NRAS, have different genetic structures, all code for proteins of 189 amino acid residues, generically designated p21. These genes acquire malignant properties by single point mutations that affect the incorporation of the 12th or 61st amino acid residue of their respective p21. KRAS is involved in malignancy much more often than is HRAS. In a study of 96 human tumors or tumor cell lines in the NIH 3T3 transforming system, Pulciani et al. (1982) found a mutated HRAS locus only in T24 bladder cancer cells, whereas transforming KRAS genes were identified in 8 different carcinomas and sarcomas. Holland et al. (2000) transferred, in a tissue-specific manner, genes encoding activated forms of Ras and Akt (OMIM Ref. No. 164730) to astrocytes and neural progenitors in mice. Holland et al. (2000) found that although neither activated Ras nor Akt alone was sufficient to induce glioblastoma multiforme (GBM; 137800) formation, the combination of

activated Ras and Akt induced high-grade gliomas with the histologic features of human GBMs. These tumors appeared to arise after gene transfer to neural progenitors, but not after transfer to differentiated astrocytes. Increased activity of RAS is found in many human GBMs, and Holland et al. (2000) demonstrated that Akt activity is increased in most of these tumors, implying that combined activation of these 2 pathways accurately models the biology of this disease. Bezieau et al. (2001) used ARMS (allele-specific amplification method) to evaluate the incidence of NRAS- and KRAS2-activating mutations in patients with multiple myeloma and related disorders. Mutations were more frequent in KRAS2 than in NRAS. The authors concluded that early mutations in these 2 oncogenes may play a major role in the oncogenesis of multiple myeloma and primary plasma cell leukemia. Rajagopalan et al. (2002) systematically evaluated mutation in BRAF (OMIM Ref. No. 164757) and KRAS in 330 colorectal tumors. There were 32 mutations in BRAF, 28 with a V599E mutation (164757.0001) and 1 each with the R461I (164757.0002), I462S (164757.0003), G463E (164757.0004), or K600E (164757.0005) mutations. All but 2 mutations seemed to be heterozygous, and in all 20

cases for which normal tissue was available, the mutations were shown to be somatic. In the same set of tumors there were 169 mutations in KRAS. No tumor exhibited mutations in both BRAF and KRAS. There was also a striking difference in the frequency of BRAF mutations between cancers with and without mismatch repair deficiency. All but 1 of the 15 BRAF mutations identified in mismatch repair deficient cases resulted in a V599E substitution. Rajagopalan et al. (2002) concluded their results provide strong support for the hypothesis that BRAF and KRAS mutations are equivalent in their tumorigenic effects. Both genes seem to be mutated at a similar phase of tumorigenesis, after initiation but before malignant conversion. Moreover, no tumor concurrently contained both BRAF and KRAS mutations. Animal model experiments lend further support to the function of KRAS2. Costa et al. (2002) crossed Nf1 heterozygote mice with mice heterozygous for a null mutation in the Kras gene and tested the Nf1 descendants. They found that the double heterozygotes with decreased Ras function had improved learning relative to Nf1 heterozygote mice. Costa et al. (2002) also showed that the Nf1 +/- mice have increased GABA-mediated inhibition and specific deficits in

long-term potentiation, both of which can be reversed by decreasing Ras function. Costa et al. (2002) concluded that learning deficits associated with Nf1 may be caused by excessive Ras activity, which leads to impairments in long-term potentiation caused by increased GABA-mediated inhibition.

[4863] It is appreciated that the abovementioned animal model for KRAS2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4864] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4865] Costa, R. M.; Federov, N. B.; Kogan, J. H.; Murphy, G. G.; Stern, J.; Ohno, M.; Kucherlapati, R.; Jacks, T.; Silva, A. J. : Mechanism for the learning deficits in a mouse model of neurofibromatosis type 1. *Nature* 415: 526–530, 2002. ; and

[4866] Rajagopalan, H.; Bardelli, A.; Lengauer, C.; Kinzler, K. W.; Vogelstein, B.; Velculescu, V. E. : RAF/RAS oncogenes and mismatch–repair status. (Letter) *Nature* 418: 934 only, 2002.

[4867] Further studies establishing the function and utilities of

KRAS2 are found in John Hopkins OMIM database record ID 190070, and in cited publications numbered 2350–2352, 512, 2353–2355, 697, 2356–2360, 1059–334, 1245, 1358–1374, 513, 1375–1376, 260 and 1378–1392 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Astrotactin (ASTN, Accession XM_045113) is another VGAM165 host target gene. ASTN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASTN BINDING SITE, designated SEQ ID:2852, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4868] Another function of VGAM165 is therefore inhibition of Astrotactin (ASTN, Accession XM_045113). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASTN. Galactokinase 2 (GALK2, Accession NM_002044) is another VGAM165 host target gene. GALK2 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by GALK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALK2 BINDING SITE, designated SEQ ID:891, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4869] Another function of VGAM165 is therefore inhibition of Galactokinase 2 (GALK2, Accession NM_002044), a gene which is involved in the metabolism of galactose. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALK2. The function of GALK2 has been established by previous studies. Lee et al. (1992) sought to clone a human galactokinase gene by its ability to substitute for the enzyme in yeast. They used a method for identifying mammalian cDNAs by complementation or other functional activity in yeast. They unexpectedly found that the gene which complemented a galactokinase-deficient strain of *Saccharomyces cerevisiae* mapped not to chromosome 17 (OMIM Ref. No. 604313) but to chromosome 15, thus calling into question which of the genes,

GK1 on 17 or GK2 on 15, is the site of the mutation in the galactokinase deficiency form of galactosemia (see OMIM Ref. No. 230200). The strategy they used might be adopted for cloning various human disease genes affecting intermediary metabolism for which yeast mutants are known. (The mapping to chromosome 15 was done by analysis of genomic DNA from a panel of human-rodent somatic cell hybrids using PCR.) Pastuszak et al. (1996) isolated an N-acetylgalactosamine (OMIM Ref. No. GalNAc) kinase from pig kidney and found that partial peptide sequences of this porcine enzyme were 90% similar to human GK2. Enzyme assays showed that human GK2 is a highly efficient GalNAc kinase with galactokinase activity when this sugar is present at high concentrations. Thus, Pastuszak et al. (1996) stated that although human GK2 was identified based on its galactokinase activity, it is actually a GalNAc kinase.

[4870] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4871] Lee, R. T.; Peterson, C. L.; Calman, A. F.; Herskowitz, I.; O'Donnell, J. J. : Cloning of a human galactokinase gene (GK2) on chromosome 15 by complementation in yeast.

Proc. Nat. Acad. Sci. 89: 10887–10891, 1992. ; and

[4872] Pastuszak, I.; O'Donnell, J.; Elbein, A. D. : Identification of the GalNAc kinase amino acid sequence. J. Biol. Chem. 271: 23653–23656, 1996.

[4873] Further studies establishing the function and utilities of GALK2 are found in John Hopkins OMIM database record ID 137028, and in cited publications numbered 882–883 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myeloid Cell Leukemia Sequence 1 (BCL2–related) (MCL1, Accession NM_021960) is another VGAM165 host target gene. MCL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:1970, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4874] Another function of VGAM165 is therefore inhibition of Myeloid Cell Leukemia Sequence 1 (BCL2–related) (MCL1, Accession NM_021960), a gene which involved in programming of differentiation and concomitant maintenance

of viability. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1. The function of MCL1 has been established by previous studies. Kozopas et al. (1993) isolated a gene, MCL1, from the ML-1 human myeloid leukemia cell line. Expression of MCL1 increased early in the induction, or programming, of differentiation in ML-1 (at 1–3 hr), before the appearance of differentiation markers and mature morphology (at 1–3 days). MCL1 showed sequence similarity, particularly in the carboxyl portion, to BCL2 (OMIM Ref. No. 151430), a gene involved in normal lymphoid development and in lymphomas with the t(14;18) chromosome translocation. Further, in contrast to proliferation-associated oncogenes, the expression of MCL1 and BCL2 relates to the programming of differentiation/development and cell viability/death. Kozopas et al. (1993) suggested that MCL1 and BCL2 are 2 members of a 'new' gene family. Bae et al. (2000) identified a short splicing variant of MCL1, which they termed MCL1S. Sequence analysis indicated that the 271-amino acid variant lacks BCL2 homology domains 1 and 2 and the transmembrane domain due to the splicing out of exon 2 during mRNA processing. Unlike the full-length

350-amino acid MCL1 protein (MCL1L), yeast 2-hybrid analysis showed that MCL1S does not interact with proapoptotic BCL2 family proteins but dimerizes with the antiapoptotic MCL1L. Overexpression of MCL1S induced apoptosis in transfected CHO cells that could be antagonized by a caspase inhibitor or specifically by MCL1L. Therefore, the authors concluded that the fate of MCL1-expressing cells may be regulated through alternative splicing mechanisms and the interactions of the resulting gene products. Using the methods of somatic cell hybrid analysis and fluorescence in situ hybridization, Craig et al. (1994) mapped MCL1 to 1q21. In the mouse, MCL1-related sequences were mapped to positions on 2 mouse chromosomes, 3 and 5, using haplotype analysis of an interspecific cross. The locus on mouse chromosome 3, *Mcl1*, was homologous to MCL1 on human chromosome 1; the second locus, *Mcl-rs*, on mouse chromosome 5, may represent a pseudogene. The proximal long arm of human chromosome 1, where MCL1 is located, is duplicated and/or rearranged in a variety of preneoplastic and neoplastic diseases, including hematologic and solid tumors. Thus, MCL1 is a candidate gene for involvement in cancer. Animal model experiments lend further support

to the function of MCL1. Rinkenberger et al. (2000) disrupted the Mcl1 locus in murine ES cells to determine the developmental roles of this Bcl2 family member. Deletion of Mcl1 resulted in periimplantation embryonic lethality. Homozygous Mcl1-deficient embryos did not implant in utero, but could be recovered at E3.5 to E4.0. Null blastocysts failed to hatch or attach in vitro, indicating a trophoblast defect, although the inner cell mass could grow in culture. Of note, homozygous Mcl1-deficient blastocysts showed no evidence of increased apoptosis, but exhibited a delay in maturation beyond the precompaction stage. This model indicates that Mcl1 is essential for preimplantation development and implantation, and suggests that it has a function beyond regulating apoptosis.

[4875] It is appreciated that the abovementioned animal model for MCL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4876] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4877] Kozopas, K. M.; Yang, T.; Buchan, H. L.; Zhou, P.; Craig, R.

W. : MCL1, a gene expressed in programmed myeloid cell differentiation, has sequence similarity to BCL2. Proc. Nat. Acad. Sci. 90: 3516–3520, 1993. ; and

[4878] Bae, J.; Leo, C. P.; Hsu, S. Y.; Hsueh, A. J. W. : MCL-1S, a splicing variant of the antiapoptotic BCL-2 family member MCL-1, encodes a proapoptotic protein possessing only the BH3 domain.

[4879] Further studies establishing the function and utilities of MCL1 are found in John Hopkins OMIM database record ID 159552, and in cited publications numbered 780–783 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_138325) is another VGAM165 host target gene. PACE4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PACE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:2434, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4880] Another function of VGAM165 is therefore inhibition of

Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_138325), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4. The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM86. Podocalyxin-like (PODXL, Accession NM_005397) is another VGAM165 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:1206, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4881] Another function of VGAM165 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with PODXL. The function of PODXL has been established by previous studies. The renal glomerular epithelial cell, or podocyte, is a highly differentiated cell with characteristic interdigitating foot processes covering the outer aspect of the glomerular basement membrane. The foot processes are covered on their apical surface with a polyanionic glycocalyx, which is an essential element of the glomerular filter. Podocalyxin, a sialoglycoprotein, is thought to be a major component of this glycocalyx. By screening human renal cortex and heart cDNA libraries with a rabbit podocalyxin-like protein-1 (PCLP1) cDNA, Kershaw et al. (1997) cloned cDNAs encoding human PCLP, or PODXL. Northern blot analysis revealed that PODXL is expressed as a major 5.9-kb transcript and minor 4.4- and 9.6-kb transcripts in various tissues, with highest expression in kidney, pancreas, and heart. The predicted 528-amino acid protein has a 21-amino acid signal peptide, a transmembrane domain, and a highly acidic intracellular domain. The amino acid sequence of human PODXL is 48% identical to that of rabbit PCLP1, with 96% identity in the transmembrane and intracellular domains. The calculated molecular mass of PODXL is 54 kD. Western blot analysis of renal glomerular

extracts showed that monoclonal antibodies against human PODXL recognize a 160/165-kD human PODXL doublet, rat podocalyxin, and rabbit PCLP1. Kershaw et al. (1997) suggested that the discrepancy between the calculated and observed masses of human PODXL is due to posttranslational modifications. By immunofluorescence of human kidney sections using antibodies against PODXL, Kershaw et al. (1997) found intense vascular endothelial cell and glomerular staining. Kershaw et al. (1997) mapped the human PODXL gene to 7q32–q33 by fluorescence in situ hybridization.

[4882] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4883] Kershaw, D. B.; Beck, S. G.; Wharram, B. L.; Wiggins, J. E.; Goyal, M.; Thomas, P. E.; Wiggins, R. C. : Molecular cloning and characterization of human podocalyxin-like protein: orthologous relationship to rabbit PCLP1 and rat podocalyxin. *J. Biol. Chem.* 272: 15708–15714, 1997. ; and

[4884] Kershaw, D. B.; Wiggins, J. E.; Wharram, B. L.; Wiggins, R. C. : Assignment of the human podocalyxin-like protein (PODXL) gene to 7q32–q33. *Genomics* 45: 239–240,

1997.

[4885] Further studies establishing the function and utilities of PODXL are found in John Hopkins OMIM database record ID 602632, and in cited publications numbered 1971–1972 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM_001244) is another VGAM165 host target gene. TNFSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF8 BINDING SITE, designated SEQ ID:811, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4886] Another function of VGAM165 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM_001244), a gene which cytokine that binds to tnfrsf8/cd30. induces proliferation of t cells. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with TNFSF8. The function of TNFSF8 has been established by previous studies. CD30 (TNFRSF8; 153243), a member of the tumor necrosis factor (TNF; OMIM Ref. No. TNF-alpha 191160) receptor superfamily, is a surface antigen used as a clinical marker for Hodgkin lymphoma and related hematologic malignancies. By performing an expression cloning screen using a chimeric protein containing the extracellular domain of CD30 as a probe, Smith et al. (1993) identified murine cells expressing a CD30 ligand. They isolated the corresponding mouse cDNA and used it to recover a homologous human cDNA from a peripheral blood T-cell (PBT) library. The predicted 234-amino acid human CD30L (CD30 ligand) protein is 72% identical to mouse Cd30l. CD30L has the characteristics of a type II membrane protein, with no apparent signal peptide and a transmembrane domain followed by a C-terminal extracellular domain. The C-terminal receptor-binding region of CD30L shares sequence similarity with other members of the TNF family, including TNF-alpha, TNF-beta (OMIM Ref. No. 153440), and CD40LG (OMIM Ref. No. 300386). Although it has a predicted molecular weight of 26 kD, recombinant CD30L expressed in mammalian cells migrated at 40 kD by SDS-

PAGE. Smith et al. (1993) attributed this discrepancy to extensive glycosylation of the extracellular domain in vivo. The recombinant human CD30L enhanced the proliferation of CD3 (OMIM Ref. No. 186790)-activated T cells, but induced differential responses, including cell death, in several CD30-positive lymphoma-derived cell lines. Northern blot analysis suggested that CD30L expression is limited to specifically induced T cells and monocytes/macrophages. Croager and Abraham (1997) determined that the CD30L gene contains 4 exons and spans more than 17.1 kb. Cerutti et al. (2000) noted that CD153 is expressed on the surface of B cells and found that this expression is upregulated upon CD154 (OMIM Ref. No. CD40LG), IL4 (OMIM Ref. No. 147780), and B-cell receptor engagement. In these cells, engagement of CD153 by T cell CD30 inhibits immunoglobulin class switch recognition as well as IgG, IgA, and IgE production, suggesting that this 'reverse signaling' modulates the CD154-dependent switching of B cells into the pool producing IgG, IgA, and IgE. By analysis of an interspecific backcross, Smith et al. (1993) mapped the Cd30l gene to the proximal region of mouse chromosome 4. These authors used fluorescence in situ hybridization to map the

human CD30L gene to 9q33.

- [4890] Further studies establishing the function and utilities of TNFSF8 are found in John Hopkins OMIM database record ID 603875, and in cited publications numbered 1733–173 and 1736 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069) is another VGAM165 host target gene. ATP1B4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:1401, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4891] Another function of VGAM165 is therefore inhibition of ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4. CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*) (CDC14A, Accession NM_003672) is another VGAM165 host target gene. CDC14A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14A BINDING SITE, designated SEQ ID:1047, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4892] Another function of VGAM165 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*)

(CDC14A, Accession NM_003672). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14A. DKFZP434C171 (Accession NM_015621) is another VGAM165 host target gene. DKFZP434C171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C171 BINDING SITE, designated SEQ ID:1641, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4893] Another function of VGAM165 is therefore inhibition of DKFZP434C171 (Accession NM_015621). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C171. Egf-like Module Containing, Mucin-like, Hormone Receptor-like Sequence 2 (EMR2, Accession NM_013447) is another VGAM165 host target gene. EMR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMR2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE, designated SEQ ID:1453, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4894] Another function of VGAM165 is therefore inhibition of Egf-like Module Containing, Mucin-like, Hormone Receptor-like Sequence 2 (EMR2, Accession NM_013447). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is another VGAM165 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:2063, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4895] Another function of VGAM165 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Ac-

cession NM_024513). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM165 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:2448 and SEQ ID:1604 respectively, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4896] Another function of VGAM165 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. ZFP100 (Accession XM_046390) is another VGAM165 host target gene. ZFP100 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP100 BINDING SITE, designated SEQ ID:2877, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4897] Another function of VGAM165 is therefore inhibition of ZFP100 (Accession XM_046390). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP100. LOC64744 (Accession XM_029830) is another VGAM165 host target gene. LOC64744 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC64744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64744 BINDING SITE, designated SEQ ID:2607, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:500.

[4898] Another function of VGAM165 is therefore inhibition of

LOC64744 (Accession XM_029830). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64744. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 166 (VGAM166) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4899] VGAM166 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM166 was detected is described hereinabove with reference to Figs. 1–8.

[4900] VGAM166 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4901] VGAM166 gene encodes a VGAM166 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM166 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM166 precursor RNA is designated SEQ ID:152, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:152 is located at position 83280 relative to the genome of Vaccinia Virus.

[4902] VGAM166 precursor RNA folds onto itself, forming VGAM166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4903] An enzyme complex designated DICER COMPLEX, `dices` the VGAM166 folded precursor RNA into VGAM166 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide se-

quence of VGAM166 RNA is designated SEQ ID:501, and is provided hereinbelow with reference to the sequence listing part.

[4904] VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM166 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[4905] VGAM166 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM166 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM166 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[4906] The complementary binding of VGAM166 RNA, herein designated VGAM RNA, to host target binding sites on VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM166 host target RNA into VGAM166 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4907] It is appreciated that VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM166 host target genes. The mRNA of each one of this plurality of VGAM166 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM166 RNA, herein designated VGAM RNA, and which when bound by VGAM166 RNA causes inhibition of translation of respective one or more VGAM166 host target proteins.

[4908] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM166 gene, herein designated VGAM GENE, on one or more VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4909] It is yet further appreciated that a function of VGAM166 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM166 correlate with, and may be deduced from, the identity of the host target genes which VGAM166 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4910] Nucleotide sequences of the VGAM166 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM166 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM166 are further described hereinbelow with reference to Table 1.

[4911] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM166 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM166 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4912] As mentioned hereinabove with reference to Fig. 1, a function of VGAM166 gene, herein designated VGAM is inhibition of expression of VGAM166 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM166 correlate with, and may be deduced from, the identity of the target genes which VGAM166 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4913] MEF-2 (Accession XM_034883) is a VGAM166 host target gene. MEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF-2 BINDING SITE, designated SEQ ID:2688, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:501.

[4914] A function of VGAM166 is therefore inhibition of MEF-2 (Accession XM_034883). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF-2. LOC146184 (Accession XM_096942) is another VGAM166

host target gene. LOC146184 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146184 BINDING SITE, designated SEQ ID:3281, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:501.

[4915] Another function of VGAM166 is therefore inhibition of LOC146184 (Accession XM_096942). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146184. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 167 (VGAM167) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4916] VGAM167 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM167 was detected is described

hereinabove with reference to Figs. 1–8.

[4917] VGAM167 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4918] VGAM167 gene encodes a VGAM167 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM167 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM167 precursor RNA is designated SEQ ID:153, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:153 is located at position 85141 relative to the genome of Vaccinia Virus.

[4919] VGAM167 precursor RNA folds onto itself, forming VGAM167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4920] An enzyme complex designated DICER COMPLEX, `dices` the VGAM167 folded precursor RNA into VGAM167 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM167 RNA is designated SEQ ID:502, and is provided hereinbelow with reference to the sequence listing part.

[4921] VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM167 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM167 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4922] VGAM167 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM167 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM167 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM167 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM167 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4923] The complementary binding of VGAM167 RNA, herein designated VGAM RNA, to host target binding sites on VGAM167 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM167 host target RNA into VGAM167 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4924] It is appreciated that VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM167 host target genes. The mRNA of each one of this plurality of VGAM167 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM167 RNA, herein designated VGAM RNA, and which when bound by VGAM167 RNA causes inhibition of translation of respective one or more VGAM167 host target proteins.

[4925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM167 gene, herein designated VGAM GENE, on one or more VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4926] It is yet further appreciated that a function of VGAM167 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM167 correlate with, and may be deduced from, the identity of the host target genes which VGAM167 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4927] Nucleotide sequences of the VGAM167 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM167 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM167 are further described hereinbelow with reference to Table 1.

[4928] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM167 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM167 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4929] As mentioned hereinabove with reference to Fig. 1, a function of VGAM167 gene, herein designated VGAM is inhibition of expression of VGAM167 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM167 correlate with, and may be deduced from, the identity of the target genes which VGAM167 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4930] Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM_001795) is a VGAM167 host target gene. CDH5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH5, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH5 BINDING SITE, designated SEQ ID:858, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4931] A function of VGAM167 is therefore inhibition of Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM_001795), a gene which associates with alpha-catenin forming a link to the cytoskeleton. Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH5. The function of CDH5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.LNK (Accession NM_005475) is another VGAM167 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:1216, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also

designated SEQ ID:502.

[4932] Another function of VGAM167 is therefore inhibition of LNK (Accession NM_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK has been established by previous studies. .By PCR using primers based on the rat Lnk sequence and by screening a Jurkat cDNA library, Li et al. (2000) obtained a cDNA encoding human LNK. Sequence analysis predicted that the 575-amino acid LNK protein contains an N-terminal proline-rich region, a pleckstrin homology (PH) domain, and an Src homology 2 (SH2) domain; the PH and SH2 domains are similar to those of the APS protein. Northern blot analysis detected low expression of a 6.8-kb LNK transcript in various lymphoid cell lines. Confocal fluorescence microscopy showed that the majority of LNK is located in the juxtanuclear region with some found near the plasma membrane. Immunoprecipitation analysis demonstrated that LNK is phosphorylated by LCK (OMIM Ref. No. 153390) but not by SYK (OMIM Ref. No. 600085) and that LNK binds to the

tyrosine-phosphorylated TCR zeta chain via its SH2 domain. Functional analysis indicated that LNK inhibits the activation of NFAT (see OMIM Ref. No. 600489) in stimulated T cells. Animal model experiments lend further support to the function of LNK. Takaki et al. (2000) generated Lnk-deficient mice and found that although they had unimpaired T-cell development in thymus, pre-B and immature B cells accumulated in enlarged spleens. In bone marrow, there was also an increase in B-lineage cells, reflecting enhanced production of B-cell progenitors due in part to hypersensitivity to SCF (KITLG; 184745) in the presence or absence of IL7 (OMIM Ref. No. 146660). Western blot analysis showed that mouse Lnk is actually a 68-kD protein

[4933] It is appreciated that the abovementioned animal model for LNK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[4934] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4935] Li, Y.; He, X.; Schembri-King, J.; Jakes, S.; Hayashi, J. : Cloning and characterization of human Lnk, an adaptor

protein with pleckstrin homology and Src homology 2 domains that can inhibit T cell activation. J. Immun. 164: 5199–5206, 2000. ; and

[4936] Takaki, S.; Sauer, K.; Iritani, B. M.; Chien, S.; Ebihara, Y.; Tsuji, K.; Takatsu, K.; Perlmutter, R. M. : Control of B cell production by the adaptor protein Lnk: definition of a conserve.

[4937] Further studies establishing the function and utilities of LNK are found in John Hopkins OMIM database record ID 605093, and in cited publications numbered 1582–1583 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Natriuretic Peptide Receptor B/guanylate Cyclase B (atrionatriuretic peptide receptor B) (NPR2, Accession NM_000907) is another VGAM167 host target gene. NPR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPR2 BINDING SITE, designated SEQ ID:786, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4938] Another function of VGAM167 is therefore inhibition of Natriuretic Peptide Receptor B/guanylate Cyclase B (atrionatriuretic peptide receptor B) (NPR2, Accession NM_000907). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPR2. CLLD8 (Accession NM_031915) is another VGAM167 host target gene. CLLD8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLLD8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLLD8 BINDING SITE, designated SEQ ID:2219, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4939] Another function of VGAM167 is therefore inhibition of CLLD8 (Accession NM_031915). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLLD8. FLJ22301 (Accession NM_024836) is another VGAM167 host target gene. FLJ22301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22301, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22301 BINDING SITE, designated SEQ ID:2094, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4940] Another function of VGAM167 is therefore inhibition of FLJ22301 (Accession NM_024836). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22301. FLJ22833 (Accession NM_022837) is another VGAM167 host target gene. FLJ22833 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22833 BINDING SITE, designated SEQ ID:2016, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4941] Another function of VGAM167 is therefore inhibition of FLJ22833 (Accession NM_022837). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ22833. KIAA0125 (Accession NM_014792) is another VGAM167 host target gene. KIAA0125 BINDING SITE1 through KIAA0125 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0125, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE1 through KIAA0125 BINDING SITE5, designated SEQ ID:1548, SEQ ID:1549, SEQ ID:1550, SEQ ID:1551 and SEQ ID:1552 respectively, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4942] Another function of VGAM167 is therefore inhibition of KIAA0125 (Accession NM_014792). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125. LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697) is another VGAM167 host target gene. LANCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL2 BINDING SITE, designated SEQ ID:1860, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4943] Another function of VGAM167 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL2. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM167 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:2997, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4944] Another function of VGAM167 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM167 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. Sorting Nexin 10 (SNX10, Accession NM_013322) is another VGAM167 host target gene. SNX10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX10 BINDING SITE, designated SEQ ID:1442, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4945] Another function of VGAM167 is therefore inhibition of Sorting Nexin 10 (SNX10, Accession NM_013322). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX10. Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession NM_014452) is another VGAM167 host target gene. TNFRSF21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TNFRSF21 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4946] Another function of VGAM167 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession NM_014452). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF21. Testis-specific Transcript, Y-linked 11 (TTY11, Accession NM_031929) is another VGAM167 host target gene. TTY11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTY11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY11 BINDING SITE, designated SEQ ID:2221, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4947] Another function of VGAM167 is therefore inhibition of Testis-specific Transcript, Y-linked 11 (TTY11, Accession NM_031929). Accordingly, utilities of VGAM167 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY11. LOC143879 (Accession XM_084666) is another VGAM167 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:3063, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4948] Another function of VGAM167 is therefore inhibition of LOC143879 (Accession XM_084666). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143879. LOC145439 (Accession XM_085144) is another VGAM167 host target gene. LOC145439 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145439 BINDING SITE, designated SEQ ID:3078, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4949] Another function of VGAM167 is therefore inhibition of LOC145439 (Accession XM_085144). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145439. LOC147353 (Accession XM_097227) is another VGAM167 host target gene. LOC147353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147353 BINDING SITE, designated SEQ ID:3293, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4950] Another function of VGAM167 is therefore inhibition of LOC147353 (Accession XM_097227). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147353. LOC221584 (Accession XM_168132) is another VGAM167 host target gene. LOC221584 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221584 BINDING SITE, designated SEQ ID:3620, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4951] Another function of VGAM167 is therefore inhibition of LOC221584 (Accession XM_168132). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221584. LOC257054 (Accession XM_171010) is another VGAM167 host target gene. LOC257054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257054 BINDING SITE, designated SEQ ID:3682, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4952] Another function of VGAM167 is therefore inhibition of

LOC257054 (Accession XM_171010). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257054. LOC91145 (Accession XM_036454) is another VGAM167 host target gene. LOC91145 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91145 BINDING SITE, designated SEQ ID:2713, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4953] Another function of VGAM167 is therefore inhibition of LOC91145 (Accession XM_036454). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91145. LOC93297 (Accession XM_050370) is another VGAM167 host target gene. LOC93297 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC93297 BINDING SITE, designated SEQ ID:2929, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:502.

[4954] Another function of VGAM167 is therefore inhibition of LOC93297 (Accession XM_050370). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93297. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 168 (VGAM168) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4955] VGAM168 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM168 was detected is described hereinabove with reference to Figs. 1–8.

[4956] VGAM168 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[4957] VGAM168 gene encodes a VGAM168 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM168 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM168 precursor RNA is designated SEQ ID:154, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:154 is located at position 83136 relative to the genome of Vaccinia Virus.

[4958] VGAM168 precursor RNA folds onto itself, forming VGAM168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4959] An enzyme complex designated DICER COMPLEX, `dices` the VGAM168 folded precursor RNA into VGAM168 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM168 RNA is designated SEQ ID:503, and is provided hereinbelow with reference to the sequence listing part.

[4960] VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM168 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4961] VGAM168 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM168 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM168 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4962] The complementary binding of VGAM168 RNA, herein designated VGAM RNA, to host target binding sites on VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM168 host target RNA into VGAM168 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4963] It is appreciated that VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM168 host target genes. The mRNA of each one of this plurality of VGAM168 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM168 RNA, herein designated VGAM RNA, and which when bound by VGAM168 RNA causes inhibition of translation of respective one or more VGAM168 host target proteins.

[4964] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM168 gene, herein designated VGAM GENE, on one or more VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4965] It is yet further appreciated that a function of VGAM168 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM168 correlate with, and may be deduced from, the identity of the host target genes which VGAM168 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4966] Nucleotide sequences of the VGAM168 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM168 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM168 are further described hereinbelow with reference to Table 1.

[4967] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM168 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM168 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4968] As mentioned hereinabove with reference to Fig. 1, a function of VGAM168 gene, herein designated VGAM is inhibition of expression of VGAM168 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM168 correlate with, and may be deduced from, the identity of the target genes which VGAM168 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4969] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813) is a VGAM168 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:1961, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:503.

[4970] A function of VGAM168 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119. Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041) is another VGAM168 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:1974, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4971] Another function of VGAM168 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession

NM_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAN. The function of GAN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM67. MHC Class II Transactivator (MHC2TA, Accession NM_000246) is another VGAM168 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:720, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4972] Another function of VGAM168 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM_000246). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Myotubular My-

opathy 1 (MTM1, Accession NM_000252) is another VGAM168 host target gene. MTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTM1 BINDING SITE, designated SEQ ID:723, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4973] Another function of VGAM168 is therefore inhibition of Myotubular Myopathy 1 (MTM1, Accession NM_000252). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTM1. AWP1 (Accession NM_019006) is another VGAM168 host target gene. AWP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AWP1 BINDING SITE, designated SEQ ID:1872, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA,

also designated SEQ ID:503.

[4974] Another function of VGAM168 is therefore inhibition of AWP1 (Accession NM_019006). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AWP1. Bladder Cancer Associated Protein (BLCAP, Accession NM_006698) is another VGAM168 host target gene. BLCAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLCAP BINDING SITE, designated SEQ ID:1324, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4975] Another function of VGAM168 is therefore inhibition of Bladder Cancer Associated Protein (BLCAP, Accession NM_006698). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLCAP. Chromosome 5 Open Reading Frame 3 (C5orf3, Accession NM_018691) is another VGAM168 host target gene. C5orf3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by C5orf3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf3 BINDING SITE, designated SEQ ID:1859, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4976] Another function of VGAM168 is therefore inhibition of Chromosome 5 Open Reading Frame 3 (C5orf3, Accession NM_018691). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf3. CRK7 (Accession NM_016507) is another VGAM168 host target gene. CRK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRK7 BINDING SITE, designated SEQ ID:1690, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4977] Another function of VGAM168 is therefore inhibition of CRK7 (Accession NM_016507). Accordingly, utilities of

VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRK7.

FLJ11101 (Accession NM_018322) is another VGAM168 host target gene. FLJ11101 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11101 BINDING SITE, designated SEQ ID:1814, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4978] Another function of VGAM168 is therefore inhibition of FLJ11101 (Accession NM_018322). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11101. FLJ12876 (Accession NM_022754) is another VGAM168 host target gene. FLJ12876 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12876 BINDING SITE,

designated SEQ ID:2004, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4979] Another function of VGAM168 is therefore inhibition of FLJ12876 (Accession NM_022754). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12876. Kruppel-like Factor 12 (KLF12, Accession NM_007249) is another VGAM168 host target gene. KLF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF12 BINDING SITE, designated SEQ ID:1374, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4980] Another function of VGAM168 is therefore inhibition of Kruppel-like Factor 12 (KLF12, Accession NM_007249). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF12. MGC4734 (Accession NM_145051) is another VGAM168 host target gene. MGC4734 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4734 BINDING SITE, designated SEQ ID:2513, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4981] Another function of VGAM168 is therefore inhibition of MGC4734 (Accession NM_145051). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4734. PRO2000 (Accession NM_014109) is another VGAM168 host target gene. PRO2000 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2000 BINDING SITE, designated SEQ ID:1469, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4982] Another function of VGAM168 is therefore inhibition of

PRO2000 (Accession NM_014109). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2000. RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296) is another VGAM168 host target gene. RAB33B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB33B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:2191, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4983] Another function of VGAM168 is therefore inhibition of RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B. Regulator of G-protein Signalling 12 (RGS12, Accession NM_002926) is another VGAM168 host target gene. RGS12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS12, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS12 BINDING SITE, designated SEQ ID:972, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4984] Another function of VGAM168 is therefore inhibition of Regulator of G-protein Signalling 12 (RGS12, Accession NM_002926). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS12. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM168 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:1522, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4985] Another function of VGAM168 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682).

Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC158381 (Accession XM_048461) is another VGAM168 host target gene. LOC158381 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158381 BINDING SITE, designated SEQ ID:2905, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4986] Another function of VGAM168 is therefore inhibition of LOC158381 (Accession XM_048461). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158381. LOC196411 (Accession XM_113714) is another VGAM168 host target gene. LOC196411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196411 BINDING SITE, designated SEQ ID:3412, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4987] Another function of VGAM168 is therefore inhibition of LOC196411 (Accession XM_113714). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196411. LOC51186 (Accession NM_016303) is another VGAM168 host target gene. LOC51186 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51186 BINDING SITE, designated SEQ ID:1680, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:503.

[4988] Another function of VGAM168 is therefore inhibition of LOC51186 (Accession NM_016303). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51186. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 169 (VGAM169) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4989] VGAM169 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM169 was detected is described hereinabove with reference to Figs. 1–8.

[4990] VGAM169 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM169 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4991] VGAM169 gene encodes a VGAM169 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM169 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM169 precursor RNA is designated SEQ ID:155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:155 is

located at position 87488 relative to the genome of Vac-
cinia Virus.

[4992] VGAM169 precursor RNA folds onto itself, forming VGAM169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4993] An enzyme complex designated DICER COMPLEX, `dices` the VGAM169 folded precursor RNA into VGAM169 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM169 RNA is designated SEQ ID:504, and is provided hereinbelow with reference to the sequence listing part.

[4994] VGAM169 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM169 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM169 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[4995] VGAM169 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM169 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM169 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM169 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM169 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[4996] The complementary binding of VGAM169 RNA, herein designated VGAM RNA, to host target binding sites on VGAM169 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM169 host target RNA into VGAM169 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4997] It is appreciated that VGAM169 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM169 host target genes. The mRNA of each one of this plurality of VGAM169 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM169 RNA, herein designated VGAM RNA, and which when bound by VGAM169 RNA causes inhibition of translation of respective one or more VGAM169

host target proteins.

[4998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM169 gene, herein designated VGAM GENE, on one or more VGAM169 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[4999] It is yet further appreciated that a function of VGAM169 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM169 correlate with, and may be deduced from, the identity of the host target genes which VGAM169 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5000] Nucleotide sequences of the VGAM169 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM169 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM169 are further described hereinbelow with reference to Table 1.

[5001] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM169 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM169 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5002] As mentioned hereinabove with reference to Fig. 1, a function of VGAM169 gene, herein designated VGAM is inhibition of expression of VGAM169 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM169 correlate with, and may be deduced from, the identity of the target genes which VGAM169 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5003] Radixin (RDX, Accession NM_002906) is a VGAM169 host target gene. RDX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDX BINDING SITE, designated SEQ ID:971, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:504.

[5004] A function of VGAM169 is therefore inhibition of Radixin (RDX, Accession NM_002906), a gene which plays a crucial role in the binding of the barbed end of actin filaments to the plasma membrane. Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDX. The function of RDX has been established by previous studies. Radixin is a cytoskeletal protein that may be important in linking actin to the plasma membrane. Cloning of the murine and porcine radixin cDNAs demonstrated a protein highly ho-

mologous to ezrin (OMIM Ref. No. 123900) and moesin (OMIM Ref. No. 309845). Wilgenbus et al. (1993) cloned and sequenced the human radixin cDNA and found the predicted amino acid sequence for the human protein to be nearly identical to those predicted for radixin in the two other species. Animal model experiments lend further support to the function of RDX. The ezrin–radixin–moesin (ERM) family of proteins crosslink actin filaments and integral membrane proteins. Radixin (encoded by Rdx) is the dominant ERM protein in the liver of wildtype mice and is concentrated at bile canalicular membranes (BCM). Kikuchi et al. (2002) showed that Rdx $-/-$ mice are normal at birth, but their serum concentrations of conjugated bilirubin begin to increase gradually around 4 weeks of age, and they show mild liver injury after 8 weeks. This phenotype is similar to human conjugated hyperbilirubinemia in Dubin–Johnson syndrome (OMIM Ref. No. 237500), which is caused by mutations in the ABCC2 gene (OMIM Ref. No. 601107), although Dubin–Johnson syndrome is not associated with overt liver injury. In wildtype mice, the protein product of the ABCC2 gene, multidrug resistance protein–2, or MRP2, concentrates at BCMs to secrete conjugated bilirubin into bile. In the BCMs of Rdx

-/- mice, Mrp2 is decreased compared with other BCM proteins such as dipeptidyl peptidase IV (CD26; 102720) and P-glycoproteins. In vitro binding studies showed that radixin associates directly with the carboxy-terminal cytoplasmic domain of human MRP2. These findings indicated that radixin is required for secretion of conjugated bilirubin through its support of Mrp2 localization at BCMs.

[5005] It is appreciated that the abovementioned animal model for RDX is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[5006] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5007] Wilgenbus, K. K.; Milatovich, A.; Francke, U.; Furthmayr, H. : Molecular cloning, cDNA sequence, and chromosomal assignment of the human radixin gene and two dispersed pseudogenes. *Genomics* 16: 199-206, 1993. ; and

[5008] Kikuchi, S.; Hata, M.; Fukumoto, K.; Yamane, Y.; Matsui, T.; Tamura, A.; Yonemura, S.; Yamagishi, H.; Keppler, D.; Tsukita, S.; Tsukita, S. : Radixin deficiency causes conjugated hyperbi.

[5009] Further studies establishing the function and utilities of

RDX are found in John Hopkins OMIM database record ID 179410, and in cited publications numbered 624–625 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transient Receptor Potential Cation Channel, Subfamily C, Member 3 (TRPC3, Accession NM_003305) is another VGAM169 host target gene. TRPC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC3 BINDING SITE, designated SEQ ID:1010, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:504.

[5010] Another function of VGAM169 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 3 (TRPC3, Accession NM_003305). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC3. LOC131000 (Accession XM_067145) is another VGAM169 host target gene. LOC131000 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC131000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131000 BINDING SITE, designated SEQ ID:3038, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:504.

[5011] Another function of VGAM169 is therefore inhibition of LOC131000 (Accession XM_067145). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131000. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 170 (VGAM170) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5012] VGAM170 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM170 was detected is described hereinabove with reference to Figs. 1-8.

[5013] VGAM170 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM170 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5014] VGAM170 gene encodes a VGAM170 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM170 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM170 precursor RNA is designated SEQ ID:156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:156 is located at position 88940 relative to the genome of Vaccinia Virus.

[5015] VGAM170 precursor RNA folds onto itself, forming VGAM170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5016] An enzyme complex designated DICER COMPLEX, `dices` the VGAM170 folded precursor RNA into VGAM170 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM170 RNA is designated SEQ ID:505, and is provided hereinbelow with reference to the sequence listing part.

[5017] VGAM170 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM170 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5018] VGAM170 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM170 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM170 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5019] The complementary binding of VGAM170 RNA, herein designated VGAM RNA, to host target binding sites on VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM170 host tar-

get RNA into VGAM170 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5020] It is appreciated that VGAM170 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM170 host target genes. The mRNA of each one of this plurality of VGAM170 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM170 RNA, herein designated VGAM RNA, and which when bound by VGAM170 RNA causes inhibition of translation of respective one or more VGAM170 host target proteins.

[5021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM170 gene, herein designated VGAM GENE, on one or more VGAM170 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5022] It is yet further appreciated that a function of VGAM170 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM170 correlate with, and may be deduced from, the identity of the host target genes which VGAM170 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5023] Nucleotide sequences of the VGAM170 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM170 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM170 are further

described hereinbelow with reference to Table 1.

[5024] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM170 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM170 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5025] As mentioned hereinabove with reference to Fig. 1, a function of VGAM170 gene, herein designated VGAM is inhibition of expression of VGAM170 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM170 correlate with, and may be deduced from, the identity of the target genes which VGAM170 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5026] Actin, Alpha 2, Smooth Muscle, Aorta (ACTA2, Accession NM_001613) is a VGAM170 host target gene. ACTA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of ACTA2 BINDING SITE, designated SEQ ID:839, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5027] A function of VGAM170 is therefore inhibition of Actin, Alpha 2, Smooth Muscle, Aorta (ACTA2, Accession NM_001613). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTA2. Aspartate Beta-hydroxylase (ASPH, Accession NM_032466) is another VGAM170 host target gene. ASPH BINDING SITE1 and ASPH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ASPH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE1 and ASPH BINDING SITE2, designated SEQ ID:2251 and SEQ ID:2253 respectively, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5028] Another function of VGAM170 is therefore inhibition of Aspartate Beta-hydroxylase (ASPH, Accession NM_032466), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in cer-

tain epidermal growth factor (EGF)-like domains of a number of proteins. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH. The function of ASPH has been established by previous studies. In hepatocellular carcinoma (HCC; 114550), one of the most prevalent tumors in the world which occurs with especially high frequency in sub-Saharan Africa and the Far East, a specific antigen is highly expressed; it is highly expressed also in cholangiocarcinomas. Lavaissiere et al. (1996) reported cDNA cloning of the human gene encoding this antigen, aspartyl(asparaginyl)-beta-hydroxylase (symbolized HAAH by them), and demonstrated that in these tumor lines it is expressed in an enzymatically active form. The gene encodes a deduced 744-amino acid polypeptide with high homology (81%) to the bovine gene (Jia et al., 1992). Lavaissiere et al. (1996) found that their cDNA human sequence was 99% homologous to the sequence for ASPH reported by Koriath et al. (1994), differing only at amino acid residues 565 (tyr to ile), 575 (trp-trp-thr to cys-gly), 585 (asp to gln), and 709 (arg to lys). They noted also a silent TCG-to-TCA transition at peptide residue 161. Lavaissiere et al. (1996) speculated

about the possible relationship of the malignant phenotype of regulated aspartyl/asparaginyl-beta-hydroxylation in EGF-like domains of proteins such as the mammalian Notch homologs (e.g., 190198, 600275, and 600276), which are known to be involved in cell differentiation and whose cytoplasmic domains have been shown to be oncogenic. By screening a heart cDNA library, followed by RT-PCR, Lim et al. (2000) isolated cDNAs encoding the 225-amino acid junctin protein and a 210-amino acid isoform. The authors noted that a 73-residue stretch in junctin has a completely matched region in the ASPH protein. Southern blot analysis indicated that junctin and ASPH exist as a single-copy gene. Northern blot analysis revealed expression of 3.0- and 4.2-kb transcripts in cardiac and skeletal muscle; expression was higher in skeletal muscle. SDS-PAGE analysis of the translated cDNAs showed expression of 26- and 28-kD proteins. By screening a skeletal muscle cDNA library with a dog junctin probe, Treves et al. (2000) identified cDNAs encoding human junctin and junctate. Sequence analysis predicted that junctate, a 299-amino acid protein, shares the first 93 amino acids of the long isoform of junctin (and, partially, of ASPH), whereas its 64 C-terminal residues are

identical to the central region of ASPH. Northern blot analysis detected a 2.6-kb transcript in heart, brain, pancreas, placenta, lung, liver, kidney, and skeletal muscle; highest levels were in heart, brain, and pancreas, and lowest levels were in skeletal muscle. In contrast, junctin was expressed only in cardiac and skeletal muscle. Southern blot and PCR analyses indicated that ASPH, junctin, and junctate are splice variants of the same gene; ASPH uses exons 1, 3, 5, and 8 through 16, whereas junctin uses exons 2, 3, 5, and 6, and junctate uses exons 2 through 5 and 8 through 16. Fluorescence microscopy showed junctate expression in sarco(endo)plasmic reticulum membranes. Immunoblot analysis indicated that junctate is expressed as a 32-kD protein in kidney microsomes. Binding analysis determined that junctate binds calcium with high capacity and moderate affinity.

[5029] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5030] Lavaissiere, L.; Jia, S.; Nishiyama, M.; de la Monte, S.; Stern, A. M.; Wands, J. R.; Friedman, P. A. : Overexpression of human aspartyl(asparaginyl)-beta-hydroxylase in hepatocellular carcinoma and cholangiocarcinoma. J. Clin. In-

vest. 98: 1313–1323, 1996. ; and

[5031] Treves, S.; Feriotto, G.; Moccagatta, L.; Gambari, R.; Zorzato, F. : Molecular cloning, expression, functional characterization, chromosomal localization, and gene structure of junctate.

[5032] Further studies establishing the function and utilities of ASPH are found in John Hopkins OMIM database record ID 600582, and in cited publications numbered 2321–2327 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cell Division Cycle 42 (GTP binding protein, 25kDa) (CDC42, Accession NM_001791) is another VGAM170 host target gene. CDC42 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDC42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC42 BINDING SITE, designated SEQ ID:856, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5033] Another function of VGAM170 is therefore inhibition of Cell Division Cycle 42 (GTP binding protein, 25kDa)

(CDC42, Accession NM_001791). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42. Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105) is another VGAM170 host target gene. CLASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP1 BINDING SITE, designated SEQ ID:2718, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5034] Another function of VGAM170 is therefore inhibition of Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105), a gene which plays a role in the local regulation of microtubule dynamics . Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP1. The function of CLASP1 has been established by previous studies. CLIP170 (OMIM Ref. No. 179838) and CLIP115 (OMIM Ref. No. 603432) are cytoplasmic linker

proteins that associate specifically with the ends of growing microtubules and may act as anticatastrophe factors. Using a yeast 2-hybrid screen with an N-terminal region of CLIP115 as bait, followed by cDNA library screening, RACE analysis, and EST database searching, Akhmanova et al. (2001) identified mouse and human cDNAs encoding 2 CLIP-associated proteins, CLASP1 and CLASP2 (OMIM Ref. No. 605853). The CLASPs are homologous to a *Drosophila* microtubule-associated protein termed Orbit or Mast. CLASP1 is identical to the protein encoded by a partial cDNA, KIAA0622, identified by Ishikawa et al. (1998), although the KIAA0622 protein lacks the N-terminal 249 amino acids of the 1,538-amino acid CLASP1 protein reported by Akhmanova et al. (2001). CLASP2 shares approximately 75% identity with the KIAA0627 protein, which is encoded by a partial cDNA also identified by Ishikawa et al. (1998). There are several CLASP isoforms due to alternative splicing. Northern blot analysis of mouse tissues detected highest expression of Clasp1 in brain, heart, and testis, while Clasp2 mRNAs were enriched in the brain. The Clasp2-beta transcript appeared to be brain specific. By RT-PCR analysis, Ishikawa et al. (1998) detected ubiquitous expression of CLASP1, which

they called KIAA0622. Akhmanova et al. (2001) showed that CLASPs bind CLIPs and microtubules, colocalize with the CLIPs at microtubule distal ends, and have microtubule-stabilizing effects in transfected cells. After serum induction, CLASPs relocate to distal segments of microtubules at the leading edge of motile fibroblasts.

Akhmanova et al. (2001) provided evidence that this asymmetric CLASP distribution is mediated by phosphatidylinositol 3-kinase (see OMIM Ref. No. 171834) and glycogen synthase kinase 3-beta (OMIM Ref. No. 605004). Antibody injections suggested that CLASP2 is required for the orientation of stabilized microtubules toward the leading edge. The authors proposed that CLASPs are involved in the local regulation of microtubule dynamics in response to positional cues.

[5035] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5036] Akhmanova, A.; Hoogenraad, C. C.; Drabek, K.; Stepanova, T.; Dortland, B.; Verkerk, T.; Vermeulen, W.; Burgering, B. M.; De Zeeuw, C. I.; Grosveld, F.; Galjart, N. : CLASPs are CLIP-115 and -170 associating proteins involved in the regional regulation of microtubule dynamics in motile fi-

broblasts. Cell 104: 923–935, 2001. ; and

[5038] Further studies establishing the function and utilities of CLASP1 are found in John Hopkins OMIM database record ID 605852, and in cited publications numbered 153 and 2136 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Copine III (CPNE3, Accession NM_003909) is another VGAM170 host target gene. CPNE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPNE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE3 BINDING SITE, designated SEQ ID:1069, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5039] Another function of VGAM170 is therefore inhibition of Copine III (CPNE3, Accession NM_003909), a gene which may function in membrane trafficking. Accordingly, utilities

of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE3. The function of CPNE3 has been established by previous studies. By screening human brain cDNAs for the potential to encode proteins larger than 50 kD, Ishikawa et al. (1998) identified a CPNE3 cDNA, which they called KIAA0636. The deduced 537-amino acid CPNE3 protein is 65.7% identical to CPNE1. By SDS-PAGE, the in vitro transcribed/translated product of the CPNE3 cDNA had a molecular mass of 65 kD. RT-PCR detected CPNE3 expression in all human tissues examined. By immunoprecipitation and kinase assays, Caudell et al. (2000) serendipitously identified a 60-kD protein identical to CPNE3. CPNE3 contains 2 N-terminal C2 domains, like CPNE1, CPNE6 (OMIM Ref. No. 605688), and CPNE7 (OMIM Ref. No. 605689), but these 4 copines have divergent C termini. CPNE3 is 63%, 52%, and 47% identical to CPNE1, CPNE6, and CPNE7, respectively. Northern blot analysis revealed ubiquitous expression of a 5.0-kb transcript. Biochemical analysis showed that CPNE3 appears to possess endogenous kinase activity, although it lacks a classic kinase domain. CPNE3 is phosphorylated on both serine and threonine residues but not on tyrosine residues.

- [5043] Further studies establishing the function and utilities of CPNE3 are found in John Hopkins OMIM database record ID 604207, and in cited publications numbered 106 and 2136 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dachshund Homolog (Drosophila) (DACH, Accession NM_080759) is another VGAM170 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:2388, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5044] Another function of VGAM170 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH has been established by previous studies. The Drosophila 'dachshund' (dac) gene is involved in both eye and leg development. Dac, 'eyeless' (ey), and 'eyes absent' (eya) are considered potential master genes in eye formation. By searching an EST database, Hammond et al. (1998) identified cDNAs corresponding to DACH, a human dac homolog. The authors used DACH cDNAs as a probe to isolate mouse Dach cDNAs from an embryonic library. Both mouse and human Dach mRNAs contain long stretches of trinucleotide repeats in their 5-prime untranslated regions. The predicted 517-amino acid human DACH pro-

tein is 99% identical to Dach. Sequence analysis revealed that *Drosophila* dac and mammalian DACH proteins share conserved domains at their N and C termini, designated Dachbox-N and Dachbox-C, respectively. The SKI (OMIM Ref. No. 164780) protooncogene and the related SNO (OMIM Ref. No. 165340) protein also contain Dachbox-N, as well as a C-terminal motif corresponding to the helical coiled-coil domain beginning in Dachbox-C. While the C-terminal motif is only weakly conserved between SKI and SNO and the dac-related proteins at the level of sequence, it is likely to be highly homologous at the level of tertiary structure and may mediate protein dimerization. Hammond et al. (1998) considered SKI, SNO, and the dac-related proteins to be members of a gene superfamily. In situ hybridization revealed that mouse Dach mRNA is expressed in eye, limb, rib primordia, central nervous system, and genital eminence in embryos. Pax6 (OMIM Ref. No. 607108), the mammalian homolog of ey, and Dach show overlapping but nonidentical expression patterns. However, Dach expression in forebrain is unaffected in Pax6 mutant (small eye) mice, indicating that, at least in brain, Pax6 does not directly regulate Dach. The authors concluded that Dach joins a group of homologous eye

genes shared by *Drosophila* and mouse, supporting the concept that a conserved genetic network operates in eye development in diverse organisms. In mice homozygously deleted for the *Six6* (OMIM Ref. No. 606326) homeodomain factor, Li et al. (2002) observed that *Six6*, in association with Dach corepressors, regulates early progenitor cell proliferation during mammalian retinogenesis and pituitary development by directly repressing cyclin-dependent kinase inhibitors, including the p27Kip1 (OMIM Ref. No. 600778) promoter. Li et al. (2002) concluded that their data revealed a molecular mechanism by which a tissue-specific transcriptional repressor-corepressor complex can provide an organ-specific strategy for physiologic expansion of precursor populations. Animal model experiments lend further support to the function of DACH. Davis et al. (2001) generated *Dach1*-deficient mice which died during postnatal day 1 and exhibited failure to suckle, cyanosis, and respiratory distress. The authors hypothesized that a lack of morphologic defects in these mutant mice may be due to compensation by an additional Dach homolog.

[5045] It is appreciated that the abovementioned animal model for DACH is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[5046] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5049] Further studies establishing the function and utilities of DACH are found in John Hopkins OMIM database record ID 603803, and in cited publications numbered 225–229 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393) is another VGAM170 host target gene. ECM2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ECM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of ECM2 BINDING SITE, designated SEQ ID:823, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5050] Another function of VGAM170 is therefore inhibition of Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ECM2. Endothelin Receptor Type A (EDNRA, Accession XM_034331) is another VGAM170 host target gene. EDNRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDNRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDNRA BINDING SITE, designated SEQ ID:2681, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5051] Another function of VGAM170 is therefore inhibition of Endothelin Receptor Type A (EDNRA, Accession XM_034331), a gene which binds endothelins, and in-

duces intracellular calcium flux and arachidonic acid accumulation. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDNRA. The function of EDNRA has been established by previous studies. See 131244.

The endothelin receptor with highest affinity for ET1 (OMIM Ref. No. 131240) has been called ETA. Cyr et al. (1991) isolated a cDNA clone of a human endothelin receptor from a placental cDNA library. The deduced amino acid sequence was 94% identical to the bovine endothelin ETA receptor and was judged to represent the human homolog. They assigned the ETRA gene to chromosome 4 by analysis of its segregation pattern in rodent/human hybrids. Hosoda et al. (1992) isolated and characterized the gene for the human endothelin-A receptor. Southern blot analyses demonstrated that it is present in single copy. The gene spans more than 40 kb and contains 8 exons and 7 introns. The transcription start site, determined by primer extension experiments, was 502 bp upstream of the methionine initiation codon. Using human/rodent somatic hybrid cell DNAs, Hosoda et al. (1992) also assigned the gene to chromosome 4. Northern blot analyses demonstrated a 4.3-kb mRNA in a wide variety of human

tissues with the highest level in the aorta and a substantial level in cultured human mesangial cells. Endothelin-1 inhibits active Na-K transport by as much as 50% in the renal tubule and other tissues (Zeidel et al., 1989). Okafor and Delamere (2001) noted that the presence of low levels of ET1 in aqueous humor combined with the potential for release of ET1 from ciliary processes suggested that the crystalline lens could be exposed to ET1 in vivo. They studied the influence of ET1 on active Na-K transport in the porcine lens. Their results suggested that ET1 inhibited active lens Na-K transport by activating EDNRA and EDNRB. Activation of the ET receptors also caused an increase in cytoplasmic calcium concentration in cultured lens epithelial cells. Both responses to ET1 appear to have a tyrosine kinase step.

[5052] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5053] Hosoda, K.; Nakao, K.; Tamura, N.; Arai, H.; Ogawa, Y.; Suga, S.; Nakanishi, S.; Imura, H. : Organization, structure, chromosomal assignment, and expression of the gene encoding the human endothelin-A receptor. J. Biol. Chem. 267: 18797-18804, 1992. ; and

- [5054] Okafor, M. C.; Delamere, N. A. : The inhibitory influence of endothelin on active sodium–potassium transport in porcine lens. *Invest. Ophthal. Vis. Sci.* 42: 1018–1023, 2001.
- [5055] Further studies establishing the function and utilities of EDNRA are found in John Hopkins OMIM database record ID 131243, and in cited publications numbered 2861–904, 514–51 and 905 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ectodermal–neural Cortex (with BTB–like domain) (ENC1, Accession NM_003633) is another VGAM170 host target gene. ENC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENC1 BINDING SITE, designated SEQ ID:1045, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.
- [5056] Another function of VGAM170 is therefore inhibition of Ectodermal–neural Cortex (with BTB–like domain) (ENC1, Accession NM_003633), a gene which is an actin–binding

protein involved in the regulation of neuronal process formation and in differentiation of neural crest cells. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENC1. The function of ENC1 has been established by previous studies. DNA damage and/or hyperproliferative signals activate wildtype p53 tumor suppressor protein (TP53; 191170), inducing cell cycle arrest or apoptosis. Mutations that inactivate p53 occur in 50% of all tumors. Polyak et al. (1997) used serial analysis of gene expression (SAGE) to evaluate cellular mRNA levels in a colorectal cancer cell line transfected with p53. Of 7,202 transcripts identified, only 14 were expressed at levels more than 10-fold higher in p53-expressing cells than in control cells. Polyak et al. (1997) termed these genes 'p53-induced genes,' or PIGs, several of which were predicted to encode redox-controlling proteins. They noted that reactive oxygen species (ROS) are potent inducers of apoptosis. Flow cytometric analysis showed that p53 expression induces ROS production, which increases as apoptosis progresses under some conditions. The authors stated that the PIG10 gene, also called ENC1, encodes an actin-binding protein. By screening fetal and adult hip-

pocampus cDNA libraries using a brain development-related cDNA as the probe, Kim et al. (1998) obtained cDNAs encoding ENC1, which they called NRPB (nuclear-restricted protein/brain). Human and mouse ENC1 share 99% amino acid identity. The deduced 589-amino acid ENC1 protein has a 114-amino acid BTB/POZ-like domain in the alpha-helical N terminus and a beta sheet bearing a 50-amino acid 'kelch' motif repeated 6 times in the C terminus. The kelch motif invariably contains 2 adjacent glycine residues and shares homology with several actin-associated proteins, including the *Drosophila* kelch protein. Northern blot analysis detected abundant expression of a 5.5-kb ENC1 transcript in fetal brain, with moderate expression in fetal heart, lung, and kidney. In adult tissues, high levels of ENC1 were detected in brain, particularly in amygdala and hippocampus, and lower levels were detected in pancreas. In 12 day- but not 10 day-postcoitus mouse embryos, expression of Enc1 was 50-fold higher in brain than in other tissues. Immunoprecipitation and Western blot analysis showed that ENC1 is expressed as a 67-kD protein in nuclear pellets and as 67- and 57-kD proteins in total cell lysates from primary neurons. Western blot analysis, immunofluores-

cence, and confocal microscopy demonstrated that Enc1 is expressed in the nuclear matrix of rat hippocampal neurons but not at all in astrocytes. By searching an EST database for homologs of mouse Enc1, Hernandez et al. (1998) identified human ENC1. Northern blot analysis detected abundant expression of an approximately 4.5-kb ENC1 transcript in brain, with lower expression in pancreas and no expression in other tissues. Within the central nervous system, expression was highest in cerebral cortex, frontal and temporal lobes, putamen, and spinal cord; lower expression was found in medulla and cerebellum, and very low levels of expression were found in the occipital pole. Low levels of ENC1 were also detected in a variety of neural tumor cell lines. ENC1 expression increased dramatically in a neuroblastoma cell line undergoing retinoic acid-induced differentiation. By differential display, Zhao et al. (2000) identified rat Enc1 as a transcript associated with differentiation of rat preadipocytes in primary culture. Using the fragment identified by differential display as probe, they cloned full-length Enc1 cDNA from a mouse brain cDNA library. By Northern blot analysis of rat tissues, Zhao et al. (2000) found high expression in brain, low expression in testis, and no expres-

sion in other tissues tested. They also found high expression of Enc1 in the stroma-vascular fraction of adipose tissue but very little in mature adipocyte fraction. Transient transfection in a 3T3 fibroblastic preadipocyte cell line resulted in subcellular colocalization with F-actin (OMIM Ref. No. 102560). Kim et al. (1998) showed that expression of ENC1 induced neuronal process formation, whereas antisense treatment inhibited neurite development. Immunoblot analysis showed that ENC1 can be phosphorylated and binds to the functionally active hypophosphorylated form of the nuclear matrix protein RB1 (OMIM Ref. No. 180200) during neuronal differentiation. Using primary cell culture of rat stroma-vascular cells, Zhao et al. (2000) found that transient early expression of Enc1 preceded the conversion of the fibroblastic preadipocytes to mature adipose. Enc1 expression also preceded expression of adipocyte-specific markers, including transcription factors known to activate adipocyte genes. Antisense transfection blocked differentiation to the mature adipocyte morphology.

[5057] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [5058] Zhao, L.; Gregoire, F.; Sul, H. S. : Transient induction of ENC-1, a kelch-related actin-binding protein, is required for adipocyte differentiation. J. Biol. Chem. 275: 16845-16850, 2000. ; and
- [5059] Hernandez, M.-C.; Andres-Barquin, P. J.; Israel, M. A. : Assignment of the ectodermal-neural cortex 1 gene (Enc1) to mouse chromosome band 13D1 by fluorescence in situ hybridization. Cy.
- [5060] Further studies establishing the function and utilities of ENC1 are found in John Hopkins OMIM database record ID 605173, and in cited publications numbered 538-541, 53 and 1073 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725) is another VGAM170 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:1999, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5061] Another function of VGAM170 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. Fc Fragment of IgA, Receptor For (FCAR, Accession NM_133279) is another VGAM170 host target gene. FCAR BINDING SITE1 and FCAR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FCAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 and FCAR BINDING SITE2, designated SEQ ID:2405 and SEQ ID:2407 respectively, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5062] Another function of VGAM170 is therefore inhibition of Fc Fragment of IgA, Receptor For (FCAR, Accession NM_133279), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCAR. The

function of FCAR has been established by previous studies. Human Fc-alpha receptor (FCAR) is present on a number of cell types, including neutrophils, monocytes, macrophages, and eosinophils. FCAR interacts with aggregated IgAs, such as IgA coated on the surface of an invading microorganism, and mediates several immunologic defense processes such as phagocytosis, antibody-dependent cell-mediated cytotoxicity, and stimulation of the release of inflammatory mediators. FCAR is a glycoprotein of 50 to 100 kD, with diversity on different cell types.

Narita et al. (2001) examined polymorphisms in the promoter and 5-prime untranslated region of the FCAR gene in 151 patients with IgA nephropathy and 163 patients with other glomerular diseases shown to have no mesangial IgA deposition by renal biopsy. Haplotype analysis showed tight linkage disequilibrium among the polymorphisms. No significant association for the genotype, allele, and haplotype frequencies of the polymorphisms were shown between the patients with histologically proven IgA nephropathy and those with other glomerular diseases. Thus, the analyzed polymorphisms did not appear to be primarily involved in susceptibility to IgA nephropathy.

[5063] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [5064] Narita, I.; Goto, S.; Saito, N.; Sakatsume, M.; Jin, S.; Omori, K.; Gejyo, F. : Genetic polymorphisms in the promoter and 5-prime UTR region of the Fc alpha receptor (CD89) are not associated with a risk of IgA nephropathy. J. Hum. Genet. 46: 694–698, 2001. ; and
- [5065] Maliszewski, C. R.; March, C. J.; Schoenborn, M. A.; Gimpel, S.; Shen, L. : Expression cloning of a human Fc receptor for IgA. J. Exp. Med. 172: 1665–1672, 1990.
- [5066] Further studies establishing the function and utilities of FCAR are found in John Hopkins OMIM database record ID 147045, and in cited publications numbered 712–714, 709–71 and 715–716 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM_000890) is another VGAM170 host target gene. KCNJ5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNJ5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ5 BINDING SITE,

designated SEQ ID:784, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5067] Another function of VGAM170 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM_000890), a gene which is a potassium inwardly-rectifying channel. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ5. The function of KCNJ5 has been established by previous studies. Potassium channels inhibited by cytosolic ATP are found in a wide variety of tissues. Tucker et al. (1995) noted that in the pancreatic beta-cell, potassium channels play a critical role in the regulation of insulin secretion, and in smooth muscle they are responsible for hypoxic vasodilatation. Moreover, these channels are the targets for several important classes of therapeutic drugs, including the antidiabetic sulfonamides and the antihypertensive potassium channel openers. In the heart, as in other tissues, K(ATP) channels are thought to couple the membrane potential to the metabolic status of the cell, and these normally quiescent channels are activated during transient ischemic and hypoxic periods when they

contribute to shortening of the cardiac action potential duration. Ashford et al. (1994) cloned the rat heart K(ATP) channel, thus enabling the isolation of the human homolog. The primary structure of KATP1 placed it in the J subfamily of inwardly rectifying potassium channels (Bond et al., 1994), such as KCNJ2 (OMIM Ref. No. 600681) and KCNJ4 (OMIM Ref. No. 600504); thus, the human homolog was designated KCNJ5. Wickman et al. (1997) reported a partial sequence of human GIRK4. They used human/rodent somatic cell hybrids to localize the human gene to chromosome 11, consistent with previous studies that localized the gene to 11q23-ter. Wickman et al. (1997) cloned the mouse Girk4 gene. They showed that the gene is expressed almost exclusively in the mouse heart. Using interspecific backcross analysis, Wickman et al. (1997) mapped the mouse Girk4 gene to chromosome 9, consistent with the mapping to human chromosome 11.

[5068] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5069] Ashford, M. L. J.; Bond, C. T.; Blair, T. A.; Adelman, J. P. : Cloning and functional expression of a rat heart KATP channel. Nature 370: 456-459, 1994. ; and

[5070] Bond, C. T.; Pessia, M.; Xia, X.-M.; Lagrutta, A.; Kavanaugh, M. P.; Adelman, J. P. : Cloning and expression of a family of inward rectifier potassium channels. *Receptors Channels* 2: 183.

[5071] Further studies establishing the function and utilities of KCNJ5 are found in John Hopkins OMIM database record ID 600734, and in cited publications numbered 1692–1695 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587) is another VGAM170 host target gene. MEF2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2A BINDING SITE, designated SEQ ID:1228, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5072] Another function of VGAM170 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide A

(myocyte enhancer factor 2A) (MEF2A, Accession NM_005587), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2A. The function of MEF2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM73. MIR16 (Accession NM_016641) is another VGAM170 host target gene. MIR16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIR16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIR16 BINDING SITE, designated SEQ ID:1704, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5073] Another function of VGAM170 is therefore inhibition of MIR16 (Accession NM_016641), a gene which is a membrane interacting protein. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIR16.

The function of MIR16 has been established by previous studies. Using a yeast 2-hybrid screen to identify proteins that interact with RGS16 (OMIM Ref. No. 602514), Zheng et al. (2000) isolated a cDNA encoding rat Mir16. By searching sequence databases with rat Mir16 as the probe, they identified a cDNA encoding human MIR16 that had been reported by Loftus et al. (1999) as part of a large-scale chromosome 16 sequencing effort. The human MIR16 protein shares 94% amino acid similarity with rat MIR16 and also shares strong homology with bacterial glycerophosphodiester phosphodiesterases. Northern blot analysis detected widespread expression of a 1.8-kb Mir16 transcript in rat tissues, with highest levels in heart, brain, liver, kidney, and testis. Similar expression was observed for human and mouse MIR16. Using yeast 2-hybrid and GST pull-down assays, Zheng et al. (2000) demonstrated that MIR16 interacts with the RGS domain of RGS16 and weakly with other RGS proteins, including RGS2 (OMIM Ref. No. 600861). Membrane association assays and endoglycosidase H digestion showed that MIR16 is an integral membrane glycoprotein. Immunofluorescence and immunoelectron microscopy localized Mir16 in the intracellular membranes in rat pituitary and on the

plasma membrane in rat liver and kidney. By genomic sequence analysis, Loftus et al. (1999) mapped the MIR16 gene to chromosome 16p.

[5074] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5075] Loftus, B. J.; Kim, U.-J.; Sneddon, V. P.; Kalush, F.; Brandon, R.; Fuhrmann, J.; Mason, T.; Crosby, M. L.; Barnstead, M.; Cronin, L.; Mays, A. D.; Cao, Y.; Xu, R. X.; Kang, H.-L.; Mitchell, S.; Eichler, E. E.; Harris, P. C.; Venter, J. C.; Adams, M. D. : Genome duplications and other features in 12 Mb of DNA sequence from human chromosome 16p and 16q. *Genomics* 60: 295–308, 1999. ; and

[5076] Zheng, B.; Chen, D.; Farquhar, M. G. : MIR16, a putative membrane glycerophosphodiester phosphodiesterase, interacts with RGS16. *Proc. Nat. Acad. Sci.* 97: 3999–4004, 2000.

[5077] Further studies establishing the function and utilities of MIR16 are found in John Hopkins OMIM database record ID 605943, and in cited publications numbered 153 and 1928 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Procollagen-proline, 2-oxoglutarate 4-dioxygenase

(proline 4-hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM_000918) is another VGAM170 host target gene. P4HB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P4HB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P4HB BINDING SITE, designated SEQ ID:787, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5078] Another function of VGAM170 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM_000918), a gene which catalyzes formation of 4-hydroxyproline in collagens. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HB. The function of P4HB has been established by previous studies. Prolyl 4-hydroxylase (EC 1.14.11.2) is involved in hydroxylation of prolyl residues in procollagen. Pihlajaniemi et al. (1987) cloned the PROHB gene.

Prolyl 4-hydroxylase is a tetramer consisting of 2 alpha (176710, 600608) and 2 beta subunits of molecular weights about 64,000 and 60,000, respectively, for the monomers. Characterization of cDNA clones for the human beta subunit indicated that the polypeptide is 508 amino acids long, including a signal peptide of 17 amino acids. Pihlajaniemi et al. (1987) also found that disulfide isomerase (EC 5.3.4.1) is a product of the same gene. When present in cells in monomeric form, the protein serves the function of DSI (Koivu et al., 1987); when present in the prolyl 4-hydroxylase tetramer, it catalyzes the formation of 4-hydroxyproline in collagen. Cheng et al. (1987) demonstrated by molecular cloning and nucleotide sequencing that cellular thyroid hormone-binding protein is also identical to the beta subunit of prolyl 4-hydroxylase and protein disulfide isomerase. Tasanen et al. (1988) isolated genomic clones for the human gene coding for this multifunctional protein. They found that the gene is about 18 kb long and consists of 11 exons. The codons for the 2 presumed active sites of protein disulfide isomerase, each a cys-gly-his-cys sequence, were found to be located 12 bp from the beginning of exons 2 and 9. Another of the many functions of protein

disulfide isomerase is its role as the smaller element of the heterodimeric microsomal triglyceride transfer protein (MTP; 157147). The unique larger subunit of this heterodimer is mutant in patients with abetalipoproteinemia (OMIM Ref. No. 200100). Since chylomicrons, very low density lipoproteins, and low density lipoproteins are absent from the plasma in abetalipoproteinemic subjects, and since the clinical pathology of abetalipoproteinemia results from deficiency of fat-soluble vitamins that are transported on apoB-containing lipoproteins, Sharp et al. (1993) proposed that inhibition of MTP may provide a specific mechanism for lowering plasma cholesterol and triglyceride levels.

[5079] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5080] Pihlajaniemi, T.; Helaakoski, T.; Tasanen, K.; Myllyla, R.; Huhtala, M.-L.; Koivu, J.; Kivirikko, K. I. : Molecular cloning of the beta-subunit of human prolyl 4-hydroxylase: this subunit and protein disulphide isomerase are products of the same gene. EMBO J. 6: 643-649, 1987. ; and

Rader, D. J.; Aggerbeck, L. P.; Gregg, R. E.; Gordon, D. A.; We.

[5082] Further studies establishing the function and utilities of P4HB are found in John Hopkins OMIM database record ID 176790, and in cited publications numbered 2171–2180, 75 and 2181 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V-raf-1 Murine Leukemia Viral Oncogene Homolog 1 (RAF1, Accession XM_087425) is another VGAM170 host target gene. RAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAF1 BINDING SITE, designated SEQ ID:3168, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5083] Another function of VGAM170 is therefore inhibition of V-raf-1 Murine Leukemia Viral Oncogene Homolog 1 (RAF1, Accession XM_087425). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAF1. Ribosomal

Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM_004755) is another VGAM170 host target gene. RPS6KA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA5 BINDING SITE, designated SEQ ID:1153, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5084] Another function of VGAM170 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM_004755), a gene which plays an essential role in the proliferation of yeast cells. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA5. The function of RPS6KA5 has been established by previous studies. Members of the extracellular signal-regulated kinase (ERK) subfamily of the mitogen-activated protein kinases (MAPKs) are activated by growth factors (see OMIM Ref. No. ERK2, 176948), while stress-activated protein kinase (SAPK) subfamily members

are strongly activated by stress signals (see OMIM Ref. No. SAPK4, 602899). MAPKAP-K1 (see OMIM Ref. No. RPS6KA1, 601684) isoforms appear to be in vivo substrates for ERKs, while MAPKAP-K2 (OMIM Ref. No. 602006) and MAPKAP-K3 (OMIM Ref. No. 602130) are in vivo substrates for SAPK2A (OMIM Ref. No. 600289) and SAPK2B (OMIM Ref. No. 602898). The MAPKAP-K1 proteins each contain 2 protein kinase domains within a single polypeptide, and 1 role of the C-terminal kinase domain is to activate the N-terminal kinase domain. By searching an EST database with the sequence of the MAPKAP-K1 N-terminal kinase domain, Deak et al. (1998) identified cDNAs encoding 2 novel kinases: mitogen- and stress-activated protein kinase-1 (MSK1) and mitogen- and stress-activated protein kinase-2 (OMIM Ref. No. 603606). The predicted 802-amino acid MSK1 protein contains 2 protein kinase domains, each of which includes the 11 subdomains characteristic of all protein kinases. MSK1 shares 43% protein sequence identity with the MAPKAP-K1 isoforms. Northern blot analysis indicated that MSK1 was expressed as a 4-kb mRNA in all tissues tested, with the highest levels of expression in brain, muscle, and placenta. Immunoelectron microscopy localized MSK1 to

the nucleus. MSK1 was activated in vitro and in vivo by either ERK or SAPK2 proteins. Deak et al. (1998) presented evidence suggesting that MSK1, rather than MAPKAP-K1 or MAPKAP-K2/K3, mediates activation of the cAMP response element-binding protein (see OMIM Ref. No. CREB1, 123810) and activating transcription factor-1 (OMIM Ref. No. 123803) by either growth factors or stress signals. By radiation hybrid analysis, Jiang et al. (1999) mapped the RPS6KA5 gene to chromosome 14q31-q32.

[5085] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5086] Deak, M.; Clifton, A. D.; Lucocq, J. M.; Alessi, D. R. : Mitogen- and stress-activated protein kinase-1 (MSK1) is directly activated by MAPK and SAPK2/p38, and may mediate activation of CREB. EMBO J. 17: 4426-4441, 1998. ; and

[5087] Jiang, C.; Yu, L.; Tu, Q.; Zhao, Y.; Zhang, H.; Zhao, S. : Assignment of a member of the ribosomal protein S6 kinase family, RPS6KA5, to human chromosome 14q31-q32.1 by radiation hybrid map.

[5088] Further studies establishing the function and utilities of RPS6KA5 are found in John Hopkins OMIM database

record ID 603607, and in cited publications numbered 665–666 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transducin (beta)–like 1X–linked (TBL1X, Accession NM_005647) is another VGAM170 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:1233, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5089] Another function of VGAM170 is therefore inhibition of Transducin (beta)–like 1X–linked (TBL1X, Accession NM_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X. The function of TBL1X has been established by previous studies. In the course of constructing a deletion map of the distal portion of the short arm of the X chromosome and the identification of the OA1 gene (OMIM Ref. No. 300500), Bassi et al. (1999)

performed cDNA selection experiments that resulted in the isolation of a novel gene, TBL1, located outside the OA1 critical region on the telomeric side. The TBL1 gene maps to the Xp22.3 region and shares significant homology with members of the WD40 repeat-containing protein family. The open reading frame encodes a 526-amino acid protein containing 6 beta-transducin repeats (WD40 motif) in the C-terminal domain. The homology with known beta-subunits of G proteins and other WD40 repeat-containing proteins is restricted to the WD40 motif. Northern blot analysis indicated that the TBL1 gene is ubiquitously expressed as 2 transcripts of approximately 2.1 and 6.0 kb. Matsuzawa and Reed (2001) elucidated a network of protein interactions in which SIAH1 (OMIM Ref. No. 602212), SIP (OMIM Ref. No. 606186), SKP1 (OMIM Ref. No. 601434), and EBI collaborate in a pathway controlling beta-catenin (OMIM Ref. No. 116806) levels, affecting activity of beta-catenin-dependent TCF (e.g., TCF1; 142410) and LEF (e.g., LEF1; 153245) transcription factors. This pathway is inducible by p53 (OMIM Ref. No. 191170), revealing a link between genotoxic injury responses and beta-catenin degradation. SIAH1 is physically linked to EBI by association with SIP, which binds SKP1.

- [5093] Further studies establishing the function and utilities of TBL1X are found in John Hopkins OMIM database record ID 300196, and in cited publications numbered 2640-2643, 164 and 2644-2645 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ARHGAP10 (Accession NM_020824) is another VGAM170 host target gene. ARHGAP10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGAP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ARHGAP10 BINDING SITE, designated SEQ ID:1926, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5094] Another function of VGAM170 is therefore inhibition of ARHGAP10 (Accession NM_020824). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP10. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM170 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:2619, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5095] Another function of VGAM170 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. Di-Ras2 (Accession NM_017594)

is another VGAM170 host target gene. Di-Ras2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Di-Ras2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Di-Ras2 BINDING SITE, designated SEQ ID:1725, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5096] Another function of VGAM170 is therefore inhibition of Di-Ras2 (Accession NM_017594). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Di-Ras2. Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM_057927) is another VGAM170 host target gene. FHOD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHOD2 BINDING SITE, designated SEQ ID:2981, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ

ID:505.

[5097] Another function of VGAM170 is therefore inhibition of Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM_057927). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHOD2. FLJ10704 (Accession NM_018185) is another VGAM170 host target gene. FLJ10704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10704 BINDING SITE, designated SEQ ID:1795, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5098] Another function of VGAM170 is therefore inhibition of FLJ10704 (Accession NM_018185). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10704. FLJ12085 (Accession NM_022771) is another VGAM170 host target gene. FLJ12085 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ12085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12085 BINDING SITE, designated SEQ ID:2006, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5099] Another function of VGAM170 is therefore inhibition of FLJ12085 (Accession NM_022771). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12085. FLJ20209 (Accession XM_098142) is another VGAM170 host target gene. FLJ20209 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20209 BINDING SITE, designated SEQ ID:3351, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5100] Another function of VGAM170 is therefore inhibition of FLJ20209 (Accession XM_098142). Accordingly, utilities of

VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20209. FLJ22174 (Accession NM_021945) is another VGAM170 host target gene. FLJ22174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22174 BINDING SITE, designated SEQ ID:1969, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5101] Another function of VGAM170 is therefore inhibition of FLJ22174 (Accession NM_021945). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22174. HSPC129 (Accession NM_016396) is another VGAM170 host target gene. HSPC129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC129 BINDING SITE,

designated SEQ ID:1685, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5102] Another function of VGAM170 is therefore inhibition of HSPC129 (Accession NM_016396). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC129. KIAA0632 (Accession NM_015545) is another VGAM170 host target gene. KIAA0632 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0632 BINDING SITE, designated SEQ ID:1634, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5103] Another function of VGAM170 is therefore inhibition of KIAA0632 (Accession NM_015545). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0632. KIAA1184 (Accession NM_022572) is another VGAM170 host target gene. KIAA1184 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1184 BINDING SITE, designated SEQ ID:1994, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5104] Another function of VGAM170 is therefore inhibition of KIAA1184 (Accession NM_022572). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1184. KIAA1671 (Accession XM_037809) is another VGAM170 host target gene. KIAA1671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:2725, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5105] Another function of VGAM170 is therefore inhibition of

KIAA1671 (Accession XM_037809). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671. KIAA1728 (Accession XM_043492) is another VGAM170 host target gene. KIAA1728 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1728 BINDING SITE, designated SEQ ID:2818, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5106] Another function of VGAM170 is therefore inhibition of KIAA1728 (Accession XM_043492). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1728. KIAA1737 (Accession XM_041115) is another VGAM170 host target gene. KIAA1737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:2789, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5107] Another function of VGAM170 is therefore inhibition of KIAA1737 (Accession XM_041115). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737. KIAA1750 (Accession XM_043067) is another VGAM170 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:2811, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5108] Another function of VGAM170 is therefore inhibition of KIAA1750 (Accession XM_043067). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. KIAA1900 (Accession XM_055299) is another

VGAM170 host target gene. KIAA1900 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1900 BINDING SITE, designated SEQ ID:2972, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5109] Another function of VGAM170 is therefore inhibition of KIAA1900 (Accession XM_055299). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1900. KIAA1946 (Accession XM_092459) is another VGAM170 host target gene. KIAA1946 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:3246, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5110] Another function of VGAM170 is therefore inhibition of KIAA1946 (Accession XM_092459). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946. LALP1 (Accession NM_020354) is another VGAM170 host target gene. LALP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LALP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LALP1 BINDING SITE, designated SEQ ID:1915, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5111] Another function of VGAM170 is therefore inhibition of LALP1 (Accession NM_020354). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LALP1. Leucine Rich Repeat (in FLII) Interacting Protein 2 (LRRFIP2, Accession NM_017724) is another VGAM170 host target gene. LRRFIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LRRFIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRFIP2 BINDING SITE, designated SEQ ID:1743, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5112] Another function of VGAM170 is therefore inhibition of Leucine Rich Repeat (in FLII) Interacting Protein 2 (LRRFIP2, Accession NM_017724). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRFIP2. MGC1842 (Accession XM_037797) is another VGAM170 host target gene. MGC1842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by MGC1842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:2724, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5113] Another function of VGAM170 is therefore inhibition of MGC1842 (Accession XM_037797). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842. MGC9753 (Accession NM_033419) is another VGAM170 host target gene. MGC9753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC9753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE, designated SEQ ID:2333, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5114] Another function of VGAM170 is therefore inhibition of MGC9753 (Accession NM_033419). Accordingly, utilities

of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9753. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM170 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:1606, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5115] Another function of VGAM170 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. Progesterone Receptor Membrane Component 2 (PGRMC2, Accession NM_006320) is another VGAM170 host target gene. PGRMC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PGRMC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PGRMC2 BINDING SITE, designated SEQ ID:1287, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5116] Another function of VGAM170 is therefore inhibition of Progesterone Receptor Membrane Component 2 (PGRMC2, Accession NM_006320). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGRMC2. Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM_086650) is another VGAM170 host target gene. PPP4R1L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP4R1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R1L BINDING SITE, designated SEQ ID:3139, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5117] Another function of VGAM170 is therefore inhibition of Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM_086650). Accordingly, utilities of

VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R1L. PRO0386 (Accession NM_018562) is another VGAM170 host target gene. PRO0386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0386 BINDING SITE, designated SEQ ID:1843, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5118] Another function of VGAM170 is therefore inhibition of PRO0386 (Accession NM_018562). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0386. PRO0456 (Accession NM_014127) is another VGAM170 host target gene. PRO0456 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0456 BINDING SITE,

designated SEQ ID:1476, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5119] Another function of VGAM170 is therefore inhibition of PRO0456 (Accession NM_014127). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0456. Solute Carrier Family 26, Member 8 (SLC26A8, Accession NM_138718) is another VGAM170 host target gene. SLC26A8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC26A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A8 BINDING SITE, designated SEQ ID:2455, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5120] Another function of VGAM170 is therefore inhibition of Solute Carrier Family 26, Member 8 (SLC26A8, Accession NM_138718). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A8. Syntrophin,

Gamma 1 (SNTG1, Accession NM_018967) is another VGAM170 host target gene. SNTG1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SNTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTG1 BINDING SITE, designated SEQ ID:1867, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5121] Another function of VGAM170 is therefore inhibition of Syntrophin, Gamma 1 (SNTG1, Accession NM_018967). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTG1. Zinc Finger Protein 396 (ZNF396, Accession XM_064632) is another VGAM170 host target gene. ZNF396 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF396 BINDING SITE, designated SEQ ID:3034, to the nucleotide sequence of VGAM170 RNA,

herein designated VGAM RNA, also designated SEQ ID:505.

[5122] Another function of VGAM170 is therefore inhibition of Zinc Finger Protein 396 (ZNF396, Accession XM_064632). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF396. LOC145098 (Accession XM_085022) is another VGAM170 host target gene. LOC145098 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145098 BINDING SITE, designated SEQ ID:3074, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5123] Another function of VGAM170 is therefore inhibition of LOC145098 (Accession XM_085022). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145098. LOC146136 (Accession XM_053737) is another VGAM170 host target gene. LOC146136 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146136 BINDING SITE, designated SEQ ID:2964, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5124] Another function of VGAM170 is therefore inhibition of LOC146136 (Accession XM_053737). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146136. LOC148195 (Accession XM_097419) is another VGAM170 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:3298, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5125] Another function of VGAM170 is therefore inhibition of

LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC149086 (Accession XM_097580) is another VGAM170 host target gene. LOC149086 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149086 BINDING SITE, designated SEQ ID:3306, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5126] Another function of VGAM170 is therefore inhibition of LOC149086 (Accession XM_097580). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149086. LOC149420 (Accession XM_086530) is another VGAM170 host target gene. LOC149420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149420 BINDING SITE, designated SEQ ID:3133, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5127] Another function of VGAM170 is therefore inhibition of LOC149420 (Accession XM_086530). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149420. LOC149912 (Accession XM_097743) is another VGAM170 host target gene. LOC149912 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149912 BINDING SITE, designated SEQ ID:3317, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5128] Another function of VGAM170 is therefore inhibition of LOC149912 (Accession XM_097743). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149912. LOC151816 (Accession XM_098122) is an-

other VGAM170 host target gene. LOC151816 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151816 BINDING SITE, designated SEQ ID:3350, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5129] Another function of VGAM170 is therefore inhibition of LOC151816 (Accession XM_098122). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151816. LOC152991 (Accession XM_098295) is another VGAM170 host target gene. LOC152991 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152991 BINDING SITE, designated SEQ ID:3365, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5130] Another function of VGAM170 is therefore inhibition of LOC152991 (Accession XM_098295). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152991. LOC157556 (Accession XM_098783) is another VGAM170 host target gene. LOC157556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157556 BINDING SITE, designated SEQ ID:3382, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5131] Another function of VGAM170 is therefore inhibition of LOC157556 (Accession XM_098783). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157556. LOC157697 (Accession XM_088365) is another VGAM170 host target gene. LOC157697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157697, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157697 BINDING SITE, designated SEQ ID:3204, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5132] Another function of VGAM170 is therefore inhibition of LOC157697 (Accession XM_088365). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157697. LOC158431 (Accession XM_098940) is another VGAM170 host target gene. LOC158431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158431 BINDING SITE, designated SEQ ID:3390, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5133] Another function of VGAM170 is therefore inhibition of LOC158431 (Accession XM_098940). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158431. LOC200488 (Accession XM_117240) is another VGAM170 host target gene. LOC200488 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200488 BINDING SITE, designated SEQ ID:3478, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5134] Another function of VGAM170 is therefore inhibition of LOC200488 (Accession XM_117240). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200488. LOC220565 (Accession XM_165417) is another VGAM170 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:3494, to the nucleotide sequence of VGAM170 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:505.

[5135] Another function of VGAM170 is therefore inhibition of LOC220565 (Accession XM_165417). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. LOC221751 (Accession XM_166370) is another VGAM170 host target gene. LOC221751 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221751 BINDING SITE, designated SEQ ID:3552, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5136] Another function of VGAM170 is therefore inhibition of LOC221751 (Accession XM_166370). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221751. LOC253978 (Accession XM_174851) is another VGAM170 host target gene. LOC253978 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253978, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253978 BINDING SITE, designated SEQ ID:3743, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5137] Another function of VGAM170 is therefore inhibition of LOC253978 (Accession XM_174851). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253978. LOC257319 (Accession XM_171049) is another VGAM170 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:3683, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5138] Another function of VGAM170 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257319. LOC92162 (Accession XM_043273) is another VGAM170 host target gene. LOC92162 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92162 BINDING SITE, designated SEQ ID:2816, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5139] Another function of VGAM170 is therefore inhibition of LOC92162 (Accession XM_043273). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92162. LOC92391 (Accession XM_044793) is another VGAM170 host target gene. LOC92391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92391 BINDING SITE, designated SEQ ID:2842, to the

nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:505.

[5140] Another function of VGAM170 is therefore inhibition of LOC92391 (Accession XM_044793). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 171 (VGAM171) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5141] VGAM171 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM171 was detected is described hereinabove with reference to Figs. 1–8.

[5142] VGAM171 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5143] VGAM171 gene encodes a VGAM171 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM171 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM171 precursor RNA is designated SEQ ID:157, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:157 is located at position 90530 relative to the genome of Vaccinia Virus.

[5144] VGAM171 precursor RNA folds onto itself, forming VGAM171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5145] An enzyme complex designated DICER COMPLEX, `dices` the VGAM171 folded precursor RNA into VGAM171 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM171 RNA is designated SEQ ID:506, and is provided hereinbelow with reference to the sequence listing part.

[5146] VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM171 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5147] VGAM171 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM171 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM171 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5148] The complementary binding of VGAM171 RNA, herein designated VGAM RNA, to host target binding sites on VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM171 host target RNA into VGAM171 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5149] It is appreciated that VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM171 host target genes. The mRNA of each one of this plurality of VGAM171 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM171 RNA, herein designated VGAM RNA, and which when bound by VGAM171 RNA causes inhibition of translation of respective one or more VGAM171 host target proteins.

[5150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM171 gene, herein designated VGAM GENE, on one or more VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[5151] It is yet further appreciated that a function of VGAM171 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM171 correlate with, and may be deduced from, the identity of the host target genes which VGAM171 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[5152] Nucleotide sequences of the VGAM171 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM171 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM171 are further described hereinbelow with reference to Table 1.

[5153] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM171 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM171 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5154] As mentioned hereinabove with reference to Fig. 1, a function of VGAM171 gene, herein designated VGAM is inhibition of expression of VGAM171 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM171 correlate with, and may be deduced from, the identity of the target genes which VGAM171 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5155] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813) is a VGAM171 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:1963, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5156] A function of VGAM171 is therefore inhibition of BTB and

CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119. Nucleolin (NCL, Accession XM_010858) is another VGAM171 host target gene. NCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCL BINDING SITE, designated SEQ ID:2552, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5157] Another function of VGAM171 is therefore inhibition of Nucleolin (NCL, Accession XM_010858), a gene which induces chromatin decondensation by binding to histone h1. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with NCL. The function of NCL has been established by previous studies. Nucleolin, also known as C23, is an abundantly expressed acidic phosphoprotein of exponentially growing cells and is located mainly in dense fibrillar regions of the nucleolus. It is involved in the control of transcription of ribosomal RNA (rRNA) genes by RNA polymerase I, in ribosome maturation and assembly, and in nucleocytoplasmic transportation of ribosomal components. From a lambda-gt10 human retinal library using a bovine cDNA probe, Srivastava et al. (1989) isolated a cDNA containing the entire coding region of nucleolin. The cDNA hybridized to a transcript of 3,000 bases from fast-dividing cells, as well as terminally differentiated tissues of several species. Translation of the nucleotide sequence showed a long open reading frame which predicted a 707-amino acid protein with several distinct domains. Srivastava et al. (1990) found that the gene consists of 14 exons with 13 introns and spans approximately 11 kb. Sequences in the 5-prime flanking region and the first intron contain a high content of GC residues consistent with nucleolin being a housekeeping gene. Southern blot analysis indicated that the gene is present in 1 copy in the haploid genome. Nicoloso et al.

(1994) demonstrated that intron 11 of the NCL gene in humans and rodents encodes a small nucleolar RNA, which they designated U20 (OMIM Ref. No. 604012). Sequence analysis revealed that U20 contains a region of perfect complementarity with a conserved sequence in 18S rRNA, suggesting that like nucleolin, it may be involved in the formation of the small ribosomal subunit

[5158] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5159] Nicoloso, M.; Caizergues-Ferrer, M.; Michot, B.; Azum, M.-C.; Bachellerie, J.-P. : U20, a novel small nucleolar RNA, is encoded in an intron of the nucleolin gene in mammals. *Molec. Cell. Biol.* 14: 5766–5776, 1994. ; and

[5160] Srivastava, M.; Fleming, P. J.; Pollard, H. B.; Burns, A. L. : Cloning and sequencing of the human nucleolin cDNA. *FEBS Lett.* 250: 99–105, 1989.

[5161] Further studies establishing the function and utilities of NCL are found in John Hopkins OMIM database record ID 164035, and in cited publications numbered 363–365 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499) is another

VGAM171 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BINDING SITE, designated SEQ ID:932, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5162] Another function of VGAM171 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 has been established by previous studies. Vielmetter et al. (1994) identified a protein with roughly 50% amino acid identity to DCC (OMIM Ref. No. 120470); it showed a dynamic pattern of expression in the developing nervous system and gastrointestinal tract of the chicken. They termed this protein neogenin. Specifically, neogenin was induced in neural cells immediately before cell cycle with-

drawal and terminal differentiation. Meyerhardt et al. (1997) cloned the human neogenin gene (symbolized NGN by them) and explored its possible role in cancer. They found cDNAs for 2 alternatively spliced forms of NGN, encoding proteins of 1,461 and 1,408 amino acids. By fluorescence in situ hybridization (FISH) they localized NGN in 15q22, a region infrequently affected by alterations in cancer. NGN transcripts of about 7.5 and 5.5 kb were detected in all adult tissues studied. In contrast to the frequent loss of DCC expression in cancers, no alterations in NGN expression were observed in more than 50 cancers studied, including glioblastoma, medulloblastoma, neuroblastoma, colorectal, breast, cervical, and pancreatic cancer cell lines, and xenografts. Based on their sequence conservation and similar expression during development, Meyerhardt et al. (1997) concluded that DCC and NGN may have related functions; however, the chromosomal location and ubiquitous expression of NGN in various human tumors suggested it is infrequently altered in cancer. Vielmetter et al. (1997) also cloned and characterized human neogenin, and symbolized the gene NEO1. They mapped NEO1 to 15q22.3–q23 by FISH.

[5163] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [5164] Meyerhardt, J. A.; Look, A. T.; Bigner, S. H.; Fearon, E. R. : Identification and characterization of neogenin, a DCC-related gene. *Oncogene* 14: 1129–1136, 1997. ; and
- [5165] Vielmetter, J.; Kayyem, J. F.; Roman, J. M.; Dreyer, W. J. : Neogenin, an avian cell surface protein expressed during terminal neuronal differentiation, is closely related to the human.
- [5166] Further studies establishing the function and utilities of NEO1 are found in John Hopkins OMIM database record ID 601907, and in cited publications numbered 2004–2006 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 21 (organic anion transporter), Member 3 (SLC21A3, Accession NM_005075) is another VGAM171 host target gene. SLC21A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A3 BINDING SITE, designated SEQ ID:1183, to the nucleotide sequence of VGAM171 RNA,

herein designated VGAM RNA, also designated SEQ ID:506.

[5167] Another function of VGAM171 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 3 (SLC21A3, Accession NM_005075), a gene which mediates the Na^{+} -independent transport of organic anions such as bsp and conjugated (taurocholate) and unconjugated (cholate) bile acids. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A3. The function of SLC21A3 has been established by previous studies. The organic anion transporter (OATP) of liver mediates the basolateral hepatocellular uptake of numerous cholephilic anions and steroidal compounds from sinusoidal blood. By screening a human liver cDNA library with a rat Oatp cDNA, Kullak-Ublick et al. (1995) cloned a cDNA encoding OATP. The deduced 670-amino acid OATP protein has 12 putative transmembrane domains and 8 potential N-linked glycosylation sites. The human and rat OATP proteins are 67% identical. In vitro translation produced unglycosylated and glycosylated human OATP proteins that migrated as 59-kD and 71-kD polypeptides, respectively, in SDS-polyacrylamide gels.

Functional studies in *Xenopus* oocytes showed that OATP mediates sodium-independent transport of the xenobiotic bromosulfophthalein and of endogenous conjugated and unconjugated bile acids. Northern blot analysis detected an approximately 2.7-kb OATP transcript in human liver, brain, lung, kidney, and testis; additional transcripts were also observed. The authors stated that the extrahepatic expression of OATP suggests a general role for OATP in transepithelial organic anion transport

[5168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5169] Kullak-Ublick, G. A.; Hagenbuch, B.; Stieger, B.; Schteingart, C. D.; Hofmann, A. F.; Wolkoff, A. W.; Meier, P. J. : Molecular and functional characterization of an organic anion transporting polypeptide cloned from human liver. :Gastroenterology 109: 1274-1282, 1995. ; and

[5170] By somatic cell hybrid analysis, Kullak-Ublick et al. (1995) mapped the SLC21A3 gene to chromosome 12. Kullak-Ublick et al. (1996) regionally localized the SLC21A3 gene to 12p12 using fluor.

[5171] Further studies establishing the function and utilities of SLC21A3 are found in John Hopkins OMIM database

record ID 602883, and in cited publications numbered 1213–1214 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. UDP-glucose Ceramide Glucosyltransferase (UGCG, Accession NM_003358) is another VGAM171 host target gene. UGCG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UGCG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UGCG BINDING SITE, designated SEQ ID:1012, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5172] Another function of VGAM171 is therefore inhibition of UDP-glucose Ceramide Glucosyltransferase (UGCG, Accession NM_003358), a gene which may serve as "flippase" as well as a glucosyltransferase. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGCG. The function of UGCG has been established by previous studies. Glycosphingolipids (GSLs) are a group of membrane components that contain lipid and sugar moieties. They are present in essentially all animal cells and are be-

lieved to have important roles in various cellular processes. UDP-glucose ceramide glucosyltransferase (UGCG; EC 2.4.1.80) catalyzes the first glycosylation step in GSL biosynthesis. The product, glucosylceramide, is the core structure of more than 300 GSLs. Ichikawa et al. (1996) cloned a UGCG cDNA by expressing a human melanoma cell cDNA library in a UGCG-deficient cell line and screening for UGCG complementation. The predicted 394-amino acid UGCG protein has a potential signal-anchor sequence and a single transmembrane domain near the N terminus, and very hydrophobic regions close to the C terminus, which may interact with the membrane. Northern blot analysis detected a 3.5-kb UGCG transcript in all human tissues examined. By Western blot analysis using antibodies against GCS, or UGCG, Watanabe et al. (1998) detected an approximately 38-kD protein in human keratinocytes. They showed that GCS transcription is upregulated during keratinocyte differentiation.

[5173] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5174] Ichikawa, S.; Sakiyama, H.; Suzuki, G.; Hidari, K. I.-P. J.; Hirabayashi, Y. : Expression cloning of a cDNA for human

ceramide glucosyltransferase that catalyzes the first glycosylation step of glycosphingolipid synthesis. Proc. Nat. Acad. Sci. 93: 4638–4643, 1996. ; and

[5175] Watanabe, R.; Wu, K.; Paul, P.; Marks, D. L.; Kobayashi, T.; Pittelkow, M. R.; Pagano, R. E. : Up-regulation of glucosylceramide synthase expression and activity during human keratinocy.

[5176] Further studies establishing the function and utilities of UGCG are found in John Hopkins OMIM database record ID 602874, and in cited publications numbered 1974–1977 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.MGC3101

(Accession NM_024043) is another VGAM171 host target gene. MGC3101 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:2047, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5177] Another function of VGAM171 is therefore inhibition of

MGC3101 (Accession NM_024043). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101. MGC3413 (Accession NM_032678) is another VGAM171 host target gene. MGC3413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3413 BINDING SITE, designated SEQ ID:2269, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5178] Another function of VGAM171 is therefore inhibition of MGC3413 (Accession NM_032678). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3413. LOC151568 (Accession NM_138483) is another VGAM171 host target gene. LOC151568 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC151568 BINDING SITE, designated SEQ ID:2444, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5179] Another function of VGAM171 is therefore inhibition of LOC151568 (Accession NM_138483). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151568. LOC152765 (Accession XM_087519) is another VGAM171 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:3175, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5180] Another function of VGAM171 is therefore inhibition of LOC152765 (Accession XM_087519). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC158314 (Accession XM_098920) is an-

other VGAM171 host target gene. LOC158314 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158314 BINDING SITE, designated SEQ ID:3387, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5181] Another function of VGAM171 is therefore inhibition of LOC158314 (Accession XM_098920). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158314. LOC57086 (Accession NM_020351) is another VGAM171 host target gene. LOC57086 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57086 BINDING SITE, designated SEQ ID:1914, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:506.

[5182] Another function of VGAM171 is therefore inhibition of LOC57086 (Accession NM_020351). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57086. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 172 (VGAM172) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5183] VGAM172 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM172 was detected is described hereinabove with reference to Figs. 1–8.

[5184] VGAM172 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5185] VGAM172 gene encodes a VGAM172 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM172

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM172 precursor RNA is designated SEQ ID:158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:158 is located at position 90682 relative to the genome of Vaccinia Virus.

[5186] VGAM172 precursor RNA folds onto itself, forming VGAM172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5187] An enzyme complex designated DICER COMPLEX, `dices` the VGAM172 folded precursor RNA into VGAM172 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 76%) nucleotide sequence of VGAM172 RNA is designated SEQ ID:507, and is provided hereinbelow with reference to the sequence listing part.

[5188] VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM172 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5189] VGAM172 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM172 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM172 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5190] The complementary binding of VGAM172 RNA, herein designated VGAM RNA, to host target binding sites on VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM172 host target RNA into VGAM172 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5191] It is appreciated that VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM172 host target genes. The mRNA of each one of this plurality of VGAM172 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM172 RNA, herein designated VGAM RNA, and which when bound by VGAM172 RNA causes inhibition of translation of respective one or more VGAM172 host target proteins.

[5192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM172 gene, herein designated VGAM GENE, on one or more VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5193] It is yet further appreciated that a function of VGAM172 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM172 correlate with, and may be deduced from, the identity of the host target genes which VGAM172 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5194] Nucleotide sequences of the VGAM172 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM172 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM172 are further described hereinbelow with reference to Table 1.

[5195] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM172 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM172 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[5196] As mentioned hereinabove with reference to Fig. 1, a function of VGAM172 gene, herein designated VGAM is inhibition of expression of VGAM172 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM172 correlate with, and may be deduced from, the identity of the target genes which VGAM172 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5197] ATP-binding Cassette, Sub-family E (OABP), Member 1 (ABCE1, Accession XM_003555) is a VGAM172 host target gene. ABCE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCE1 BINDING SITE, designated SEQ ID:2533, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:507.

[5198] A function of VGAM172 is therefore inhibition of ATP-binding Cassette, Sub-family E (OABP), Member 1 (ABCE1, Accession XM_003555), a gene which a Ribonuclease L in-

hibitor. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCE1. The function of ABCE1 has been established by previous studies. The 2–5A/RNase L system is a main pathway for viral interferon (OMIM Ref. No. 147660) action and may play a general role in RNA metabolism. In the pathway, IFN stimulation activates 2–5A synthetases which convert ATP into a set of unusual oligomers known as 2–5A; these oligomers in turn activate RNase L (RNase 4; 180435), which leads to inhibition of protein synthesis by cleaving mRNAs at the 3–prime side of UpNp sequences (Bisbal et al., 1995). Aubry et al. (1996) also cloned the RNS4I gene and found both a 3.8–kb and a 2.4–kb transcript expressed differentially in all tissues examined. Highest expression of the 2.4–kb transcript was found in the testis, while the 3.8–kb transcript was most abundant in ovaries, testis, spleen, and pancreas.

[5199] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5200] Bisbal, C.; Martinand, C.; Silhol, M.; Lebleu, B.; Salehzada, T. : Cloning and characterization of a RNase L inhibitor: a

new component of the interferon-regulated 2–5A pathway. J. Biol. Chem. 270: 13308–13317, 1995. ; and

[5201] Aubry, F.; Mattei, M.–G.; Barque, J.–P.; Galibert, F. : Chromosomal localization and expression pattern of the RNase L inhibitor gene. FEBS Lett. 381: 135–139, 1996.

[5202] Further studies establishing the function and utilities of ABCE1 are found in John Hopkins OMIM database record ID 601213, and in cited publications numbered 159 and 1594 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis-specific Homologous Recombination (yeast) (DMC1, Accession NM_007068) is another VGAM172 host target gene. DMC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMC1 BINDING SITE, designated SEQ ID:1356, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:507.

[5203] Another function of VGAM172 is therefore inhibition of DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis–

specific Homologous Recombination (yeast) (DMC1, Accession NM_007068). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMC1. Pan-hematopoietic Expression (PHEMX, Accession NM_139022) is another VGAM172 host target gene. PHEMX BINDING SITE1 through PHEMX BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PHEMX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHEMX BINDING SITE1 through PHEMX BINDING SITE4, designated SEQ ID:2467, SEQ ID:2468, SEQ ID:2469 and SEQ ID:1237 respectively, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:507.

[5204] Another function of VGAM172 is therefore inhibition of Pan-hematopoietic Expression (PHEMX, Accession NM_139022), a gene which is an important tumor-suppressor gene region. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHEMX. The function of PHEMX has been established by previous studies.

Lee et al. (1999) noted that 7 imprinted genes had been identified on 11p15: IGF2 (OMIM Ref. No. 147470), which encodes an important autocrine growth factor in cancer; H19 (OMIM Ref. No. 103280), an untranslated RNA whose imprinting regulates IGF2; ASCL2 (OMIM Ref. No. 601886), a homolog of *Drosophila* achaete–scute that is expressed in the trophoblast; KCNQ1 (OMIM Ref. No. 192500), which encodes a voltage–gated potassium channel; p57(KIP2) (CDKN1C; 600856), which encodes a cyclin–dependent kinase inhibitor; TSSC5 (IMPT1; 602631), which encodes a predicted transmembrane transporter; and TSSC3 (OMIM Ref. No. 602131), also known as IPL, a homolog of a mouse apoptosis–inducing gene. With the exception of IGF2, all of these genes are expressed from the maternal allele. Because of the large number of imprinted genes on 11p15, spanning approximately 1 Mb, this region appears to represent 1 of 2 known large imprinted domains in the human genome, the other being the Prader–Willi/Angelman syndrome domain of 15q11–q13 (see OMIM Ref. No. 105830). Koi et al. (1993) isolated a sub–chromosomal transferable fragment (STF) that suppresses in vitro growth of the rhabdomyosarcoma cell line RD, confirming the existence of 1 or more tumor suppressor

genes within this region. Hu et al. (1997) found that the STF spans approximately 2.5 Mb, with D11S12 at its proximal end and D11S1318 at its distal end. Within a cluster of imprinted genes in this STF, Lee et al. (1999) identified 2 novel genes, designated TSSC4 (OMIM Ref. No. 603852) and TSSC6, that were not imprinted in any of the fetal or extraembryonic tissues examined. The TSSC6 cDNA encodes a predicted protein of 290 amino acids that shows no close similarity to previously reported proteins. Northern blot analysis failed to detect TSSC6 gene expression; however, RT-PCR analysis suggested that the TSSC6 gene is ubiquitously expressed at low levels. The TSSC4 and TSSC6 genes are both located in the center of the 1-Mb imprinted domain on 11p15 that contains the 7 imprinted genes. Thus, the imprinted gene domain of 11p15 appears to contain at least 2 imprinted subdomains, between which the TSSC4 and TSSC6 genes substantially escape imprinting, due either to a lack of initial silencing or to an early developmental relaxation of imprinting

[5205] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5206] Koi, M.; Johnson, L. A.; Kalikin, L. M.; Little, P. F. R.; Nakamura, Y.; Feinberg, A. P. : Tumor cell growth arrest caused by subchromosomal transferable DNA fragments from chromosome 11. Science 260: 361–364, 1993. ; and

[5207] Lee, M. P.; Brandenburg, S.; Landes, G. M.; Adams, M.; Miller, G.; Feinberg, A. P. : Two novel genes in the center of the 11p15 imprinted domain escape genomic imprinting. Hum. Molec. Ge.

[5208] Further studies establishing the function and utilities of PHEMX are found in John Hopkins OMIM database record ID 603853, and in cited publications numbered 111 and 1671 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0979 (Accession NM_015032) is another VGAM172 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:1602, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:507.

[5209] Another function of VGAM172 is therefore inhibition of KIAA0979 (Accession NM_015032). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. LOC220672 (Accession XM_017177) is another VGAM172 host target gene. LOC220672 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220672 BINDING SITE, designated SEQ ID:2566, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:507.

[5210] Another function of VGAM172 is therefore inhibition of LOC220672 (Accession XM_017177). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220672. LOC257336 (Accession XM_171216) is another VGAM172 host target gene. LOC257336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257336, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257336 BINDING SITE, designated SEQ ID:3694, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:507.

[5211] Another function of VGAM172 is therefore inhibition of LOC257336 (Accession XM_171216). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257336. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 173 (VGAM173) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5212] VGAM173 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM173 was detected is described hereinabove with reference to Figs. 1–8.

[5213] VGAM173 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM173 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[5214] VGAM173 gene encodes a VGAM173 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM173 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM173 precursor RNA is designated SEQ ID:159, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:159 is located at position 90131 relative to the genome of Vaccinia Virus.

[5215] VGAM173 precursor RNA folds onto itself, forming VGAM173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5216] An enzyme complex designated DICER COMPLEX, `dices` the VGAM173 folded precursor RNA into VGAM173 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM173 RNA is designated SEQ ID:508, and is provided hereinbelow with reference to the sequence listing part.

[5217] VGAM173 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM173 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5218] VGAM173 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM173 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM173 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5219] The complementary binding of VGAM173 RNA, herein designated VGAM RNA, to host target binding sites on VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM173 host target RNA into VGAM173 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[5220] It is appreciated that VGAM173 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM173 host target genes. The mRNA of each one of this plurality of VGAM173 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM173 RNA, herein designated VGAM RNA, and which when bound by VGAM173 RNA causes inhibition of translation of respective one or more VGAM173 host target proteins.

[5221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM173 gene, herein designated VGAM GENE, on one or more VGAM173 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5222] It is yet further appreciated that a function of VGAM173 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM173 correlate with, and may be deduced from, the identity of the host target genes which VGAM173 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5223] Nucleotide sequences of the VGAM173 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM173 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM173 are further described hereinbelow with reference to Table 1.

[5224] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM173 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM173 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5225] As mentioned hereinabove with reference to Fig. 1, a function of VGAM173 gene, herein designated VGAM is inhibition of expression of VGAM173 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM173 correlate with, and may be deduced from, the identity of the target genes which VGAM173 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5226] MGC16169 (Accession NM_033115) is a VGAM173 host target gene. MGC16169 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16169 BINDING SITE, designated SEQ ID:2312, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:508.

[5227] A function of VGAM173 is therefore inhibition of MGC16169 (Accession NM_033115). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16169. LOC151414 (Accession XM_087197) is another VGAM173 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151414 BINDING SITE, designated SEQ ID:3156, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:508.

[5228] Another function of VGAM173 is therefore inhibition of LOC151414 (Accession XM_087197). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151414. LOC153817 (Accession XM_027964) is another VGAM173 host target gene. LOC153817 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153817, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153817 BINDING SITE, designated SEQ ID:2591, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:508.

[5229] Another function of VGAM173 is therefore inhibition of LOC153817 (Accession XM_027964). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153817. LOC51145 (Accession NM_016158) is another VGAM173 host target gene. LOC51145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51145 BINDING SITE, designated SEQ ID:1665, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:508.

[5230] Another function of VGAM173 is therefore inhibition of LOC51145 (Accession NM_016158). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC51145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 174 (VGAM174) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5231] VGAM174 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM174 was detected is described hereinabove with reference to Figs. 1–8.

[5232] VGAM174 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5233] VGAM174 gene encodes a VGAM174 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM174 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM174 precursor RNA is designated SEQ

ID:160, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:160 is located at position 89784 relative to the genome of Vaccinia Virus.

[5234] VGAM174 precursor RNA folds onto itself, forming VGAM174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5235] An enzyme complex designated DICER COMPLEX, `dices` the VGAM174 folded precursor RNA into VGAM174 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM174 RNA is designated SEQ ID:509, and is provided hereinbelow with reference to the sequence list-

ing part.

[5236] VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM174 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5237] VGAM174 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM174 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM174 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5238] The complementary binding of VGAM174 RNA, herein designated VGAM RNA, to host target binding sites on VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM174 host target RNA into VGAM174 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5239] It is appreciated that VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM174 host target genes. The mRNA of each one of this plurality of VGAM174 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM174 RNA, herein designated VGAM

RNA, and which when bound by VGAM174 RNA causes inhibition of translation of respective one or more VGAM174 host target proteins.

[5240] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM174 gene, herein designated VGAM GENE, on one or more VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5241] It is yet further appreciated that a function of VGAM174 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM174 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM174 correlate with, and may be deduced from, the identity of the host target genes which VGAM174 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5242] Nucleotide sequences of the VGAM174 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM174 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM174 are further described hereinbelow with reference to Table 1.

[5243] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM174 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM174 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5244] As mentioned hereinabove with reference to Fig. 1, a function of VGAM174 gene, herein designated VGAM is

inhibition of expression of VGAM174 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM174 correlate with, and may be deduced from, the identity of the target genes which VGAM174 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5245] Enamelin (ENAM, Accession NM_031889) is a VGAM174 host target gene. ENAM BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ENAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAM BINDING SITE, designated SEQ ID:2215, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:509.

[5246] A function of VGAM174 is therefore inhibition of Enamelin (ENAM, Accession NM_031889). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAM. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM174 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:2750, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:509.

[5247] Another function of VGAM174 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. GAPCENA (Accession NM_012197) is another VGAM174 host target gene. GAPCENA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAPCENA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAPCENA BINDING SITE, designated SEQ ID:1412, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:509.

- [5248] Another function of VGAM174 is therefore inhibition of GAPCENA (Accession NM_012197). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAPCENA. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 175 (VGAM175) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [5249] VGAM175 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM175 was detected is described hereinabove with reference to Figs. 1–8.
- [5250] VGAM175 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [5251] VGAM175 gene encodes a VGAM175 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM175 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM175 precursor RNA is designated SEQ ID:161, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:161 is located at position 91213 relative to the genome of Vaccinia Virus.

[5252] VGAM175 precursor RNA folds onto itself, forming VGAM175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5253] An enzyme complex designated DICER COMPLEX, `dices` the VGAM175 folded precursor RNA into VGAM175 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide se-

quence of VGAM175 RNA is designated SEQ ID:510, and is provided hereinbelow with reference to the sequence listing part.

[5254] VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM175 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5255] VGAM175 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM175 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM175 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[5256] The complementary binding of VGAM175 RNA, herein designated VGAM RNA, to host target binding sites on VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM175 host target RNA into VGAM175 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5257] It is appreciated that VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM175 host target genes. The mRNA of each one of this plurality of VGAM175 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM175 RNA, herein designated VGAM RNA, and which when bound by VGAM175 RNA causes inhibition of translation of respective one or more VGAM175 host target proteins.

[5258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM175 gene, herein designated VGAM GENE, on one or more VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5259] It is yet further appreciated that a function of VGAM175 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM175 correlate with, and may be deduced from, the identity of the host target genes which VGAM175 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[5260] Nucleotide sequences of the VGAM175 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM175 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM175 are further described hereinbelow with reference to Table 1.

[5261] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM175 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM175 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5262] As mentioned hereinabove with reference to Fig. 1, a function of VGAM175 gene, herein designated VGAM is inhibition of expression of VGAM175 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM175 correlate with, and may be deduced from, the identity of the target genes which VGAM175 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5263] Heterogeneous Nuclear Ribonucleoprotein A2/B1 (HNRPA2B1, Accession NM_002137) is a VGAM175 host target gene. HNRPA2B1 BINDING SITE1 and HNRPA2B1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPA2B1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA2B1 BINDING SITE1 and HNRPA2B1 BINDING SITE2, designated SEQ ID:902 and SEQ ID:2186 respectively, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:510.

[5264] A function of VGAM175 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein A2/B1 (HNRPA2B1,

Accession NM_002137), a gene which involves with pre-mrna processing. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA2B1. The function of HNRPA2B1 has been established by previous studies. The splicing of pre-mRNA into the mature product occurs in a multicomponent complex constituted by small nuclear ribonucleoprotein particles (snRNP) and proteins such as splicing factors and heterogeneous nuclear ribonucleoprotein (hnRNP) proteins. The hnRNP proteins are a family of at least 20 polypeptides whose precise role in RNA processing remains to be fully defined. The hnRNP A2 belongs, with A1, B1, and B2, to the basic protein subset of the hnRNP complex. All these proteins share a modular structure consisting of 2 conserved RNA binding domains linked to less conserved gly-rich domains. Biamonti et al. (1994) isolated and sequenced the A2 gene and compared it with the previously described A1 gene (HNRPA1; 164017). The HNRPA2 gene was mapped to 7p15 by fluorescence in situ hybridization. It was found to be split into 12 exons, including an alternatively spliced 36 nucleotide mini-exon specific for the human hnRNP protein B1. Biamonti et al. (1994) showed that the intron/

exon organization of the A2 gene is identical to that of the A1 gene over its entire length, indicating a common origin by gene duplication. Kozu et al. (1995) also cloned the HNRPA2B1 gene and showed that it is 9-kb long and produces both the B1 and A2/B1 mRNAs as a consequence of alternative splicing. The transcripts were found in all cells with the B1 isoform occurring at about 2–5% of the A2/B1 level. See nuclear ribonucleoprotein particle C1 protein (OMIM Ref. No. 164020).

[5265] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5266] Biamonti, G.; Ruggiu, M.; Saccone, S.; Della Valle, G.; Riva, S. : Two homologous genes, originated by duplication, encode the human hnRNP proteins A2 and A1. *Nucleic Acids Res.* 22: 1996–2002, 1994. ; and

[5267] Kozu, T.; Henrich, B.; Schafer, K. P. : Structure and expression of the gene (HNRPA2B1) encoding the human hnRNP protein A2/B1. *Genomics* 25: 365–371, 1995.

[5268] Further studies establishing the function and utilities of HNRPA2B1 are found in John Hopkins OMIM database record ID 600124, and in cited publications numbered 2014 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference. LOC146481 (Accession XM_085484) is another VGAM175 host target gene. LOC146481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146481 BINDING SITE, designated SEQ ID:3092, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:510.

[5269] Another function of VGAM175 is therefore inhibition of LOC146481 (Accession XM_085484). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146481. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 176 (VGAM176) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5270] VGAM176 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM176 was detected is described hereinabove with reference to Figs. 1–8.

[5271] VGAM176 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM176 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5272] VGAM176 gene encodes a VGAM176 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM176 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM176 precursor RNA is designated SEQ ID:162, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:162 is located at position 90963 relative to the genome of Vaccinia Virus.

[5273] VGAM176 precursor RNA folds onto itself, forming VGAM176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5274] An enzyme complex designated DICER COMPLEX, `dices` the VGAM176 folded precursor RNA into VGAM176 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM176 RNA is designated SEQ ID:511, and is provided hereinbelow with reference to the sequence listing part.

[5275] VGAM176 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM176 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM176 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5276] VGAM176 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM176 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM176 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM176 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM176 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5277] The complementary binding of VGAM176 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM176 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM176 host target RNA into VGAM176 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5278] It is appreciated that VGAM176 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM176 host target genes. The mRNA of each one of this plurality of VGAM176 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM176 RNA, herein designated VGAM RNA, and which when bound by VGAM176 RNA causes inhibition of translation of respective one or more VGAM176 host target proteins.

[5279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM176 gene, herein designated VGAM GENE, on one or more VGAM176 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5280] It is yet further appreciated that a function of VGAM176 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM176 correlate with, and may be deduced from, the identity of the host target genes which VGAM176 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5281] Nucleotide sequences of the VGAM176 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM176 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM176 are further described hereinbelow with reference to Table 1.

[5282] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM176 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM176 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5283] As mentioned hereinabove with reference to Fig. 1, a function of VGAM176 gene, herein designated VGAM is inhibition of expression of VGAM176 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM176 correlate with, and may be deduced from, the identity of the target genes which VGAM176 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5284] LOC146229 (Accession XM_085387) is a VGAM176 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:3087, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:511.

[5285] A function of VGAM176 is therefore inhibition of LOC146229 (Accession XM_085387). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 177 (VGAM177) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5286] VGAM177 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM177 was detected is described hereinabove with reference to Figs. 1-8.

[5287] VGAM177 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5288] VGAM177 gene encodes a VGAM177 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM177 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM177 precursor RNA is designated SEQ ID:163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:163 is located at position 92476 relative to the genome of Vaccinia Virus.

[5289] VGAM177 precursor RNA folds onto itself, forming VGAM177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5290] An enzyme complex designated DICER COMPLEX, `dices` the VGAM177 folded precursor RNA into VGAM177 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM177 RNA is designated SEQ ID:512, and is provided hereinbelow with reference to the sequence listing part.

[5291] VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM177 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5292] VGAM177 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM177 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM177 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5293] The complementary binding of VGAM177 RNA, herein designated VGAM RNA, to host target binding sites on VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM177 host tar-

get RNA into VGAM177 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5294] It is appreciated that VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM177 host target genes. The mRNA of each one of this plurality of VGAM177 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM177 RNA, herein designated VGAM RNA, and which when bound by VGAM177 RNA causes inhibition of translation of respective one or more VGAM177 host target proteins.

[5295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM177 gene, herein designated VGAM GENE, on one or more VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5296] It is yet further appreciated that a function of VGAM177 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM177 correlate with, and may be deduced from, the identity of the host target genes which VGAM177 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5297] Nucleotide sequences of the VGAM177 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM177 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM177 are further

described hereinbelow with reference to Table 1.

[5298] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM177 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM177 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5299] As mentioned hereinabove with reference to Fig. 1, a function of VGAM177 gene, herein designated VGAM is inhibition of expression of VGAM177 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM177 correlate with, and may be deduced from, the identity of the target genes which VGAM177 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5300] FLJ20413 (Accession NM_017808) is a VGAM177 host target gene. FLJ20413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated

SEQ ID:1753, to the nucleotide sequence of VGAM177 RNA, herein designated VGAM RNA, also designated SEQ ID:512.

[5301] A function of VGAM177 is therefore inhibition of FLJ20413 (Accession NM_017808). Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 178 (VGAM178) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5302] VGAM178 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM178 was detected is described hereinabove with reference to Figs. 1–8.

[5303] VGAM178 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5304] VGAM178 gene encodes a VGAM178 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM178 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM178 precursor RNA is designated SEQ ID:164, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:164 is located at position 93077 relative to the genome of Vaccinia Virus.

[5305] VGAM178 precursor RNA folds onto itself, forming VGAM178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5306] An enzyme complex designated DICER COMPLEX, `dices` the VGAM178 folded precursor RNA into VGAM178 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM178 RNA is designated SEQ ID:513, and is provided hereinbelow with reference to the sequence listing part.

[5307] VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM178 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[5308] VGAM178 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM178 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM178 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5309] The complementary binding of VGAM178 RNA, herein designated VGAM RNA, to host target binding sites on VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM178 host target RNA into VGAM178 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5310] It is appreciated that VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM178 host target genes. The mRNA of each one of this plurality of VGAM178 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM178 RNA, herein designated VGAM RNA, and which when bound by VGAM178 RNA causes inhibition of translation of respective one or more VGAM178 host target proteins.

[5311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM178 gene, herein designated VGAM GENE, on one or more VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[5312] It is yet further appreciated that a function of VGAM178 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM178 correlate with, and may be deduced from, the identity of the host target genes which VGAM178 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[5313] Nucleotide sequences of the VGAM178 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM178 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM178 are further described hereinbelow with reference to Table 1.

[5314] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM178 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM178 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5315] As mentioned hereinabove with reference to Fig. 1, a function of VGAM178 gene, herein designated VGAM is inhibition of expression of VGAM178 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM178 correlate with, and may be deduced from, the identity of the target genes which VGAM178 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5316] C-reactive Protein, Pentraxin-related (CRP, Accession XM_049673) is a VGAM178 host target gene. CRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRP BINDING SITE, designated SEQ ID:2920, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5317] A function of VGAM178 is therefore inhibition of C-reactive Protein, Pentraxin-related (CRP, Accession

XM_049673). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRP. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM_004660) is another VGAM178 host target gene. DBY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DBY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBY BINDING SITE, designated SEQ ID:1140, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5318] Another function of VGAM178 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM_004660), a gene which plays a key role in the spermatogenic process. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBY. The function of DBY has been established by previous studies. Foresta et al. (2000) reported a complete sequence map of the AZFa region (see OMIM Ref. No. 415000), the genomic structure of AZFa genes, and

their deletion analysis in 173 infertile men with well-defined spermatogenic alterations. Deletions were found in 9 patients: DBY alone was deleted in 6, USP9Y only in 1, and 1 each with USP9Y-DBY or DBY-UTY missing. No patients solely lacked UTY. Patients lacking DBY exhibited either Sertoli cell-only syndrome or severe hypospermatogenesis. Expression analysis of AZFa genes and their X homologs revealed ubiquitous expression for all of them except DBY; a shorter DBY transcript was expressed only in testis. The authors suggested that DBY plays a key role in the spermatogenic process. Using COS cells to express candidate Y chromosome genes and mouse dendritic cells for antigenic presentation, Scott et al. (2000) determined that Dby expresses 2 major histocompatibility complex (MHC) class II-restricted minor histocompatibility HY determinants. No stimulatory activity was found with these epitopes in cells transfected with Smcy (OMIM Ref. No. 426000) or Uty, both of which express MHC class I-restricted epitopes.

[5319] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5320] Foresta, C.; Ferlin, A.; Moro, E. : Deletion and expression

analysis of AZFa genes on the human Y chromosome revealed a major role for DBY in male infertility. Hum. Molec. Genet. 9: 1161–1169, 2000. ; and

[5321] Scott, D.; Addey, C.; Ellis, P; James, E.; Mitchell, M. J.; Saut, N.; Jurcevic, S.; Simpson, E. : Dendritic cells permit identification of genes encoding MHC class II–restricted epitope.

[5322] Further studies establishing the function and utilities of DBY are found in John Hopkins OMIM database record ID 400010, and in cited publications numbered 199 and 2526 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V-erb-b2 Erythroblastic Leukemia Viral Oncogene Homolog 2, Neuro/ glioblastoma Derived Oncogene Homolog (avian) (ERBB2, Accession NM_004448) is another VGAM178 host target gene. ERBB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERBB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB2 BINDING SITE, designated SEQ ID:1115, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ

ID:513.

[5323] Another function of VGAM178 is therefore inhibition of V-erb-b2 Erythroblastic Leukemia Viral Oncogene Homolog 2, Neuro/glioblastoma Derived Oncogene Homolog (avian) (ERBB2, Accession NM_004448), a gene which Tyrosine kinase receptor. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB2. The function of ERBB2 has been established by previous studies. The oncogene originally called NEU was derived from rat neuro/glioblastoma cell lines. It encodes a tumor antigen, p185, which is serologically related to EGFR, the epidermal growth factor receptor (OMIM Ref. No. 131550). EGFR maps to chromosome 7. Yang-Feng et al. (1985) found, however, that the human homolog, which they designated NGL (to avoid confusion with neuraminidase, which is also symbolized NEU), maps to 17q12-q22 by in situ hybridization and to 17q21-qter in somatic cell hybrids. Thus, the SRO is 17q21-q22. Coussens et al. (1985) identified a potential cell surface receptor of the tyrosine kinase gene family and characterized it by cloning the gene. Its primary sequence is very similar to that of the human epidermal growth factor receptor. Because of the seem-

ingly close relationship to the human EGF receptor, the authors called the gene HER2. By Southern blot analysis of somatic cell hybrid DNA and by in situ hybridization, the gene was assigned to 17q21–q22. This chromosomal location of the gene is coincident with the NEU oncogene, which suggests that the 2 genes may in fact be the same; indeed, sequencing indicates that they are identical (Francke, 1988). Van de Vijver et al. (1988) found a correlation between overexpression of NEU protein and the large-cell, comedo growth type of ductal carcinoma. They could find no correlation, however, with lymph-node status or tumor recurrence. Slamon et al. (1989) described the role of HER2/NEU in breast (OMIM Ref. No. 114480) and ovarian cancer (OMIM Ref. No. 167000), which together account for one-third of all cancers in women and approximately one-quarter of cancer-related deaths in females. The HER2 gene is amplified and HER2 is overexpressed in 25 to 30% of breast cancers, increasing the aggressiveness of the tumor. Slamon et al. (2001) found that herceptin increased the clinical benefit of first-line chemotherapy in metastatic breast cancer that overexpresses HER2. In a population-based case control study of the val655-to-ile polymorphism (164870.0001), Xie et al.

(2000) found that the val allele was associated with an increased risk of breast cancer, particularly among younger women. Because of the significant ethnic differences in the incidence of breast cancer and other solid tumors, Ameyaw et al. (2002) undertook a study of 7 ethnic groups from 3 separate continents. The frequency of the val allele was highly variable between populations (1 to 24%). The continental African populations had a lower frequency than did the other subjects, corresponding with the lower incidence and lower risk of breast cancer in African women compared with Caucasian and African-American women. Animal model experiments lend further support to the function of ERBB2. An activated mutant form of ERBB2 is rarely found in human cancer. Instead, wildtype ERBB2 is overexpressed and/or amplified in 10 to 30% of breast cancers, where it correlates with chemoresistance and poor patient prognosis. Herceptin, a monoclonal antibody against ERBB2, is an effective treatment for a subset of patients with advanced breast cancer. Liu et al. (2002) used a transgenic mouse model with targeted aberrant overexpression of ERBB2 to determine whether genetic instability is associated with mammary tumorigenesis in vivo in the absence of heritable defects in known

DNA maintenance genes.

[5324] It is appreciated that the abovementioned animal model for ERBB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[5325] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5326] Coussens, L.; Yang-Feng, T. L.; Liao, Y.-C.; Chen, E.; Gray, A.; McGrath, J.; Seeburg, P. H.; Libermann, T. A.; Schlessinger, J.; Francke, U.; Levinson, A.; Ullrich, A. : Tyrosine kinase receptor with extensive homology to EGF receptor shares chromosomal location with NEU oncogene. [5327] Liu, S.; Liu, W.; Jakubczak, J. L.; Erexson, G. L.; Tindall, K. R.; Chan, R.; Muller, W. J.; Adhya, S.; Garges, S.; Merlino, G. : Genetic instability favoring transversions associated w.

[5328] Further studies establishing the function and utilities of ERBB2 are found in John Hopkins OMIM database record ID 164870, and in cited publications numbered 399-400, 2668-478, 2789-494, 62 and 698-702 listed in the bibliography section hereinbelow, which are also hereby incor-

porated by reference. Integrin, Alpha 1 (ITGA1, Accession XM_032902) is another VGAM178 host target gene. ITGA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA1 BINDING SITE, designated SEQ ID:2660, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5329] Another function of VGAM178 is therefore inhibition of Integrin, Alpha 1 (ITGA1, Accession XM_032902). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA1. Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139) is another VGAM178 host target gene. MS4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A1 BINDING SITE, designated SEQ ID:710, to the nucleotide se-

quence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5330] Another function of VGAM178 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139), a gene which may be involved in the regulation of b-cell activation and proliferation. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A1. The function of MS4A1 has been established by previous studies. B1, also known as CD20 or MS4A1, is a human B-lymphocyte surface molecule that is widely expressed during B-cell ontogeny, from early pre-B-cell developmental stages until final differentiation into plasma cells. Functional studies using monoclonal antibodies have shown that antibody binding to B1 inhibits B-cell proliferation caused by mitogens and inhibits B-cell differentiation. Tedder et al. (1988) described the primary structure of CD20. Tedder et al. (1989) showed that the CD20 gene is 16 kb long and contains 8 exons. Using in situ hybridization and Southern blotting of hybrid cell DNA, Tedder et al. (1989) showed that the CD20 gene is located on 11q12-q13. This localization places the CD20 gene near the site of the

t(11;14)(q13;q32) translocation that is found in a subgroup of B-cell malignancies; see 151400. The CD20 gene was found to lie on the centromeric side of BCL1 (OMIM Ref. No. 168461) and to be separated from BCL1 by at least 50 kb of DNA. The proximal location of CD20 was indicated by the fact that it is not translocated to chromosome 14 in the translocation. It must be located between the centromere of chromosome 11 and the 3-prime end of BCL1. Szepetowski et al. (1993) studied amplification of the BCL1 region in breast cancer to map genes in the 11q13 band. CD20 was the most proximal of 13 genes located centromeric to BCL1 and was in the same group as CD5, PGA4 (OMIM Ref. No. 169720), and FTH1 (OMIM Ref. No. 134770). Distal to this cluster was a group of 3 genes, COX8 (OMIM Ref. No. 123870), PYGM (OMIM Ref. No. 232600), and SEA (OMIM Ref. No. 165110), of which the most proximal was COX8.

[5331] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5332] Szepetowski, P.; Perucca-Lostanlen, D.; Gaudray, P. : Mapping genes according to their amplification status in tumor cells: contribution to the map of 11q13. Genomics

16: 745–750, 1993. ; and

[5333] Tedder, T. F.; Klejman, G.; Schlossman, S. F.; Saito, H. :
Structure of the gene encoding the human B lymphocyte
differentiation antigen CD20 (B1). J. Immun. 142:
2560–2568, 1989.

[5334] Further studies establishing the function and utilities of
MS4A1 are found in John Hopkins OMIM database record
ID 112210, and in cited publications numbered 104 and
1041–1043 listed in the bibliography section hereinbelow,
which are also hereby incorporated by reference. ARSDR1
(Accession NM_016026) is another VGAM178 host target
gene. ARSDR1 BINDING SITE is HOST TARGET binding site
found in the 3` untranslated region of mRNA encoded by
ARSDR1, corresponding to a HOST TARGET binding site
such as BINDING SITE I, BINDING SITE II or BINDING SITE III.
Table 2 illustrates the complementarity of the nucleotide
sequences of ARSDR1 BINDING SITE, designated SEQ
ID:1656, to the nucleotide sequence of VGAM178 RNA,
herein designated VGAM RNA, also designated SEQ
ID:513.

[5335] Another function of VGAM178 is therefore inhibition of
ARSDR1 (Accession NM_016026). Accordingly, utilities of
VGAM178 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ARSDR1. ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069) is another VGAM178 host target gene. ATP1B4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:1400, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5336] Another function of VGAM178 is therefore inhibition of ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4. FLJ00024 (Accession XM_033361) is another VGAM178 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:2665, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5337] Another function of VGAM178 is therefore inhibition of FLJ00024 (Accession XM_033361). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ10493 (Accession NM_018112) is another VGAM178 host target gene. FLJ10493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10493 BINDING SITE, designated SEQ ID:1782, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5338] Another function of VGAM178 is therefore inhibition of FLJ10493 (Accession NM_018112). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10493. FLJ11175 (Accession NM_018349) is another VGAM178

host target gene. FLJ11175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11175 BINDING SITE, designated SEQ ID:1816, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5339] Another function of VGAM178 is therefore inhibition of FLJ11175 (Accession NM_018349). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11175. KIAA0977 (Accession NM_014900) is another VGAM178 host target gene. KIAA0977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0977 BINDING SITE, designated SEQ ID:1578, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5340] Another function of VGAM178 is therefore inhibition of KIAA0977 (Accession NM_014900). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0977. Thyroid Hormone Receptor Interactor 3 (TRIP3, Accession XM_085661) is another VGAM178 host target gene. TRIP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP3 BINDING SITE, designated SEQ ID:3102, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5341] Another function of VGAM178 is therefore inhibition of Thyroid Hormone Receptor Interactor 3 (TRIP3, Accession XM_085661). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP3. LOC149117 (Accession XM_097587) is another VGAM178 host target gene. LOC149117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149117, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149117 BINDING SITE, designated SEQ ID:3307, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5342] Another function of VGAM178 is therefore inhibition of LOC149117 (Accession XM_097587). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149117. LOC196993 (Accession XM_116971) is another VGAM178 host target gene. LOC196993 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196993 BINDING SITE, designated SEQ ID:3471, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5343] Another function of VGAM178 is therefore inhibition of LOC196993 (Accession XM_116971). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC196993. LOC56965 (Accession NM_020213) is another VGAM178 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:1900, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:513.

[5344] Another function of VGAM178 is therefore inhibition of LOC56965 (Accession NM_020213). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56965. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 179 (VGAM179) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5345] VGAM179 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM179 was detected is described hereinabove with reference to Figs. 1–8.

[5346] VGAM179 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM179 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5347] VGAM179 gene encodes a VGAM179 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM179 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM179 precursor RNA is designated SEQ ID:165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:165 is located at position 92769 relative to the genome of Vaccinia Virus.

[5348] VGAM179 precursor RNA folds onto itself, forming VGAM179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5349] An enzyme complex designated DICER COMPLEX, `dices` the VGAM179 folded precursor RNA into VGAM179 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM179 RNA is designated SEQ ID:514, and is provided hereinbelow with reference to the sequence listing part.

[5350] VGAM179 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM179 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM179 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5351] VGAM179 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM179 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM179 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM179 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM179 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5352] The complementary binding of VGAM179 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM179 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM179 host target RNA into VGAM179 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5353] It is appreciated that VGAM179 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM179 host target genes. The mRNA of each one of this plurality of VGAM179 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM179 RNA, herein designated VGAM RNA, and which when bound by VGAM179 RNA causes inhibition of translation of respective one or more VGAM179 host target proteins.

[5354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM179 gene, herein designated VGAM GENE, on one or more VGAM179 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5355] It is yet further appreciated that a function of VGAM179 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM179 correlate with, and may be deduced from, the identity of the host target genes which VGAM179 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5356] Nucleotide sequences of the VGAM179 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM179 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM179 are further described hereinbelow with reference to Table 1.

[5357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM179 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM179 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5358] As mentioned hereinabove with reference to Fig. 1, a function of VGAM179 gene, herein designated VGAM is inhibition of expression of VGAM179 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM179 correlate with, and may be deduced from, the identity of the target genes which VGAM179 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5359] Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM_167853) is a VGAM179 host target gene. NUMA1 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by NUMA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:3604, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5360] A function of VGAM179 is therefore inhibition of Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM_167853), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1. The function of NUMA1 has been established by previous studies. The NuMA protein was one of the first to be described as a cell cycle-related protein based on a distinct immunofluorescent staining pattern: in interphase, NuMA is present throughout the nucleus, and in mitosis, it localizes to the spindle apparatus (Lydersen and Pettijohn, 1980). Some patients with autoimmune disease have antibodies directed against the NuMA protein. The full-length NUMA cDNA (Compton et al., 1992; Yang et al., 1992) predicts a protein with the largest known coiled-coil region in a pro-

tein. By fluorescence in situ hybridization, Sparks et al. (1993) demonstrated that the NUMA1 gene is present in single copy and located on 11q13. Acute promyelocytic leukemia (APL) is uniquely associated with chromosomal translocations that disrupt the gene encoding the retinoic acid receptor, RARA (OMIM Ref. No. 180240). In more than 99% of cases, this disruption results in the formation of a fusion of the RARA gene with the PML gene (OMIM Ref. No. 102578). In rare variants of APL, the RARA gene has been found to be fused to 1 of 2 other genes, PLZF (OMIM Ref. No. 176797) and NPM (OMIM Ref. No. 164040). Although RARA dysregulation is evidently important in APL, the role of the various fusion partners is unclear. Wells et al. (1997) characterized a fourth APL gene fusion, which linked exons encoding the retinoic acid and DNA-binding domains of RARA to 5-prime exons of NUMA1. The NUMA/RARA fusion protein existed in sheet-like nuclear aggregates with which normal NUMA partly colocalized. In contrast to t(15;17) APL (the usual variety) the intracellular distribution of PML was normal in these cells. Wells et al. (1997) suggested that interference with retinoid signaling, and not disruption of PML organization, is essential to the APL phenotype. Their work implicated for the first time an

element of the mitotic apparatus in the molecular pathogenesis of human malignancy. The proband of their study was a Caucasian male first seen at 6 months of age for investigation of multiple cutaneous lesions. Despite this unusual clinical presentation, peripheral blood morphology and cell-surface immunophenotype were typical of APL. Routine analysis of diagnostic bone marrow revealed a clonal cytogenetic abnormality, t(11;17)(q13;q21). The patient was treated with all-trans retinoic acid and achieved complete remission; he remained in morphologic remission 38 months after autologous bone marrow transplantation.

- [5361] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [5362] Lydersen, B. K.; Pettijohn, D. E. : Human-specific nuclear protein that associates with the polar region of the mitotic apparatus: distribution in a human/hamster hybrid cell. Cell 22: 489-499, 1980. ; and
- [5363] Wells, R. A.; Catzavelos, C.; Kamel-Reid, S. : Fusion of retinoic acid receptor alpha to NuMA, the nuclear mitotic apparatus protein, by a variant translocation in acute promyelocytic l.

[5364] Further studies establishing the function and utilities of NUMA1 are found in John Hopkins OMIM database record ID 164009, and in cited publications numbered 504–510 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM_005073) is another VGAM179 host target gene. SLC15A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:1182, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5365] Another function of VGAM179 is therefore inhibition of Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM_005073), a gene which is a H(+)-coupled peptide transporter. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC15A1. The function of SLC15A1 has been established by previ-

ous studies. In mammalian small intestine, the proton-coupled peptide transporter is responsible for the absorption of small peptides arising from digestion of dietary proteins. Fei et al. (1994) isolated a cDNA clone encoding a hydrogen ion/peptide cotransporter from a rabbit intestinal cDNA library. Liang et al. (1995) screened a human intestinal cDNA library with a probe derived from the rabbit cotransporter cDNA and identified a cDNA which, when expressed in HeLa cells or in *Xenopus laevis* oocytes, induced proton-dependent peptide transport activity. The predicted protein consisted of 708 amino acids with 12 membrane-spanning domains and 2 putative sites for protein kinase C-dependent phosphorylation. The cDNA-induced transport process accepted dipeptides, tripeptides, and amino beta-lactam antibiotics as substrates, but could not transport free amino acids. The human cotransporter showed 81% identity and 92% similarity to the rabbit cotransporter, but showed only a weak homology to the proton-coupled peptide transport proteins present in bacteria and yeast. By analysis of somatic cell hybrids and by isotopic in situ hybridization, Liang et al. (1995) mapped the human gene to 13q33-q34. Adibi (1997) reviewed the biology and function of the human

intestinal oligopeptide transporter, which he symbolized PEPT1. Studies indicated that it transports dipeptides and tripeptides but not free amino acids or peptides with more than 3 amino acid residues and that its driving force for uphill transport requires proton binding and presence of an inside-negative membrane potential. A membrane protein, HTP1, which appeared to be associated with the oligopeptide transporter, had also been cloned. Adibi (1997) pointed out the importance of the transporter in nutritional and pharmacologic therapies; for example, it has allowed the use of oligopeptides as a source of nitrogen for enteral feeding and the use of the oral route for delivery of peptidomimetic drugs such as beta-lactam antibiotics.

[5366] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5367] Liang, R.; Fei, Y.-J.; Prasad, P. D.; Ramamoorthy, S.; Han, H.; Yang-Feng, T. L.; Hediger, M. A.; Ganapathy, V.; Leibach, F. H. : Human intestinal H(+)/peptide cotransporter: cloning, functional expression, and chromosomal localization. J. Biol. Chem. 270: 6456-6463, 1995. ; and

[5368] Adibi, S. A. : The oligopeptide transporter (Pept-1) in hu-

man intestine: biology and function. Gastroenterology 113: 332–340, 1997.

[5369] Further studies establishing the function and utilities of SLC15A1 are found in John Hopkins OMIM database record ID 600544, and in cited publications numbered 1789–1791 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CCR4–NOT Transcription Complex, Subunit 3 (CNOT3, Accession NM_014516) is another VGAM179 host target gene. CNOT3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CNOT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT3 BINDING SITE, designated SEQ ID:1505, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5370] Another function of VGAM179 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 3 (CNOT3, Accession NM_014516). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT3. FLJ10898

(Accession XM_002486) is another VGAM179 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:2527, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5371] Another function of VGAM179 is therefore inhibition of FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. FLJ14686 (Accession NM_032825) is another VGAM179 host target gene. FLJ14686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14686 BINDING SITE, designated SEQ ID:2286, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:514.

[5372] Another function of VGAM179 is therefore inhibition of FLJ14686 (Accession NM_032825). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14686. HDAC9-PENDING (Accession NM_014707) is another VGAM179 host target gene. HDAC9-PENDING BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC9-PENDING, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC9-PENDING BINDING SITE, designated SEQ ID:1526, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5373] Another function of VGAM179 is therefore inhibition of HDAC9-PENDING (Accession NM_014707). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC9-PENDING. ZAK (Accession NM_133646) is another VGAM179 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:2427, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5374] Another function of VGAM179 is therefore inhibition of ZAK (Accession NM_133646). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC119548 (Accession XM_058404) is another VGAM179 host target gene. LOC119548 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC119548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119548 BINDING SITE, designated SEQ ID:2984, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5375] Another function of VGAM179 is therefore inhibition of LOC119548 (Accession XM_058404). Accordingly, utilities

of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119548. LOC153937 (Accession XM_087813) is another VGAM179 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:3185, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5376] Another function of VGAM179 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. LOC221895 (Accession XM_166511) is another VGAM179 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221895 BINDING SITE, designated SEQ ID:3568, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:514.

[5377] Another function of VGAM179 is therefore inhibition of LOC221895 (Accession XM_166511). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221895. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 180 (VGAM180) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5378] VGAM180 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM180 was detected is described hereinabove with reference to Figs. 1–8.

[5379] VGAM180 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM180 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5380] VGAM180 gene encodes a VGAM180 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM180 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM180 precursor RNA is designated SEQ ID:166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:166 is located at position 93665 relative to the genome of Vaccinia Virus.

[5381] VGAM180 precursor RNA folds onto itself, forming VGAM180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5382] An enzyme complex designated DICER COMPLEX, `dices` the VGAM180 folded precursor RNA into VGAM180 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM180 RNA is designated SEQ ID:515, and is provided hereinbelow with reference to the sequence listing part.

[5383] VGAM180 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM180 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[5384] VGAM180 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM180 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM180 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5385] The complementary binding of VGAM180 RNA, herein designated VGAM RNA, to host target binding sites on VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM180 host target RNA into VGAM180 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5386] It is appreciated that VGAM180 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM180 host target genes. The mRNA of each one of this plurality of VGAM180 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM180 RNA, herein designated VGAM RNA, and which when bound by VGAM180 RNA causes inhibition of translation of respective one or more VGAM180 host target proteins.

[5387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM180 gene, herein designated VGAM GENE, on one or more VGAM180 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[5388] It is yet further appreciated that a function of VGAM180 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM180 correlate with, and may be deduced from, the identity of the host target genes which VGAM180 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5389] Nucleotide sequences of the VGAM180 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM180 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM180 are further described hereinbelow with reference to Table 1.

[5390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM180 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM180 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5391] As mentioned hereinabove with reference to Fig. 1, a function of VGAM180 gene, herein designated VGAM is inhibition of expression of VGAM180 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM180 correlate with, and may be deduced from, the identity of the target genes which VGAM180 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5392] B-cell Linker (BLNK, Accession NM_013314) is a VGAM180 host target gene. BLNK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BLNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLNK BINDING SITE, designated SEQ ID:1441, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:515.

[5393] A function of VGAM180 is therefore inhibition of B-cell

Linker (BLNK, Accession NM_013314), a gene which is a component of the BCR transducer complex, promotes B-cell development. Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLNK. The function of BLNK has been established by previous studies. In evaluating patients with absent B cells, Minegishi et al. (1999) identified a male with a homozygous splice defect in the gene encoding the cytoplasmic adaptor protein BLNK (604515.0001). Although this patient had normal numbers of pro-B cells, he had no pre-B cells or mature B cells, indicating that BLNK plays a critical role in orchestrating the pro-B cell to pre-B cell transition. The immune system and overall growth and development were otherwise normal in this patient, suggesting that BLNK function is highly specific. The patient had developed recurrent otitis at 8 months of age; after 2 episodes of pneumonia, he was evaluated for immunodeficiency at 16 months of age. At that time, he had no detectable serum IgG, IgM, or IgA, and he had less than 1% B cells in the peripheral circulation. He was started on gammaglobulin replacement, and between 2 and 20 years of age he did well except for chronic otitis and sinusitis, hepatitis C acquired from in-

travenous gammaglobulin, and an episode of protein-losing enteropathy in adolescence. Animal model experiments lend further support to the function of BLNK. Pappu et al. (1999) generated mice deficient in BLNK by targeted disruption. B-cell development in BLNK $-/-$ mice was blocked at the transition from B220+CD43+ progenitor B to B220+CD43- precursor B cells. Only a small percentage of IgM M++, but not mature IgM(lo)IgD(hi), B cells were detected in the periphery. Pappu et al. (1999) concluded that BLNK is an essential component of the B-cell receptor signaling pathways and is required to promote B-cell development.

[5394] It is appreciated that the abovementioned animal model for BLNK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[5395] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5396] Minegishi, Y.; Rohrer, J.; Coustan-Smith, E.; Lederman, H. M.; Pappu, R.; Campana, D.; Chan, A. C.; Conley, M. E. : An essential role for BLNK in human B cell development. *Science* 286: 1954-1957, 1999. ; and

- [5397] Pappu, R.; Cheng, A. M.; Li, B.; Gong, Q.; Chiu, C.; Griffin, N.; White, M.; Sleckman, B. P.; Chan, A. C. : Requirement for B cell linker protein (BLNK) in B cell development. Science.
- [5398] Further studies establishing the function and utilities of BLNK are found in John Hopkins OMIM database record ID 604515, and in cited publications numbered 1234–123 and 1067–1068 listed in the bibliography section herein–below, which are also hereby incorporated by reference. FLJ20152 (Accession NM_019000) is another VGAM180 host target gene. FLJ20152 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20152 BINDING SITE, designated SEQ ID:1870, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:515.
- [5399] Another function of VGAM180 is therefore inhibition of FLJ20152 (Accession NM_019000). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20152.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 181 (VGAM181) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5400] VGAM181 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM181 was detected is described hereinabove with reference to Figs. 1–8.

[5401] VGAM181 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM181 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5402] VGAM181 gene encodes a VGAM181 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM181 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM181 precursor RNA is designated SEQ ID:167, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:167 is

located at position 96078 relative to the genome of Vac-
cinia Virus.

[5403] VGAM181 precursor RNA folds onto itself, forming VGAM181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5404] An enzyme complex designated DICER COMPLEX, `dices` the VGAM181 folded precursor RNA into VGAM181 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM181 RNA is designated SEQ ID:516, and is provided hereinbelow with reference to the sequence listing part.

[5405] VGAM181 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM181 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM181 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[5406] VGAM181 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM181 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM181 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM181 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM181 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[5407] The complementary binding of VGAM181 RNA, herein designated VGAM RNA, to host target binding sites on VGAM181 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM181 host target RNA into VGAM181 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5408] It is appreciated that VGAM181 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM181 host target genes. The mRNA of each one of this plurality of VGAM181 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM181 RNA, herein designated VGAM RNA, and which when bound by VGAM181 RNA causes inhibition of translation of respective one or more VGAM181

host target proteins.

[5409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM181 gene, herein designated VGAM GENE, on one or more VGAM181 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5410] It is yet further appreciated that a function of VGAM181 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM181 correlate with, and may be deduced from, the identity of the host target genes which VGAM181 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [5411] Nucleotide sequences of the VGAM181 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM181 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM181 are further described hereinbelow with reference to Table 1.
- [5412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM181 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM181 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [5413] As mentioned hereinabove with reference to Fig. 1, a function of VGAM181 gene, herein designated VGAM is inhibition of expression of VGAM181 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM181 correlate with, and may be deduced from, the identity of the target genes which VGAM181 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5414] BTG Family, Member 2 (BTG2, Accession NM_006763) is a VGAM181 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:1330, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5415] A function of VGAM181 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM_006763). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408) is another VGAM181 host target gene. CELSR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CELSR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR2 BINDING SITE, designated SEQ ID:826, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5416] Another function of VGAM181 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR2. The function of CELSR2 has been established by previous studies. The domain that characterizes epidermal growth factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF-like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor-ligand interactions. Proteins with EGF-like domains often consist of more than 1,000 amino acids, have multiple copies of the EGF-like domain, and contain additional domains known to be involved in

specific protein–protein interactions. To identify proteins containing EGF–like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF–like motif. They identified several partial cDNAs encoding novel proteins with EGF–like domains, such as EGFL2, which they named MEGF3. The predicted partial EGFL2 protein has at least 5 cadherin motifs, 6 EGF–like domains, 2 laminin G domains (see OMIM Ref. No. 601033), 7 transmembrane domains, and a cytoplasmic proline–rich sequence. Human EGFL2 appears to have a domain structure identical to that of rat Megf2 (OMIM Ref. No. 604264), whose complete coding sequence was also isolated by the authors. Northern blot analysis detected rat Megf3 expression in several regions of the brain.

[5417] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5418] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kwarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new

genes (KIAA0201–KIAA0280) deduced by analysis of cDNA clones from cell line KG–1 and brain. DNA Res. 3:

321–329, 1996. ; and

[5419] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high–molecular–weight proteins with multiple EGF–like motifs by motif–trap screening. Genomic.

[5420] Further studies establishing the function and utilities of CELSR2 are found in John Hopkins OMIM database record ID 604265, and in cited publications numbered 2121 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GRB2–associated Binding Protein 2 (GAB2, Accession NM_012296) is another VGAM181 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:1424 and SEQ ID:2375 respectively, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5421] Another function of VGAM181 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM_012296), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 has been established by previous studies. The GAB2 gene encodes a 100-kd adapter molecule that is the principal activator of phosphatidylinositol-3 kinase (PIK3; OMIM Ref. No. 171833) in response to activation of the high affinity IgE receptor (see OMIM Ref. No. 147140). Zhao et al. (1999) demonstrated that upon tyrosine phosphorylation, GAB2 physically interacts with SHP2 tyrosine phosphatase and GRB2 adapter protein (OMIM Ref. No. 604330). GAB2 has an inhibitory effect on the activation of ELK1 (OMIM Ref. No. 311040)-dependent transcription triggered by a dominant active Ras (OMIM Ref. No. 190020) mutant or under growth factor stimulation, whereas GAB1 acts to potentiate slightly the ELK1 activity in the same system. In contrast to the reciprocal effects of GAB1 and GAB2 in mediating ELK1 induction, these 2 molecules have a similar function in extracellular signal-regulated kinase activation induced by either oncogenic

Ras or growth factor stimulation. Zhao et al. (1999) concluded that GAB1 and GAB2 may have distinct roles in coupling cytoplasmic–nuclear signal transduction. Animal model experiments lend further support to the function of GAB2. Gu et al. (2001) generated mice deficient in Gab2 by homologous recombination. Gab2 $-/-$ mice were viable and generally healthy; however, the response of Gab2 $-/-$ mast cells to stimulation of the high affinity IgE receptor Fc-epsilon-RI (see OMIM Ref. No. 147140) was defective. Accordingly, allergic reactions, such as passive cutaneous and systemic anaphylaxis, were markedly impaired in Gab $-/-$ mice. Biochemical analyses revealed that signaling pathways dependent on phosphatidylinositol-3 hydroxykinase (PI3K), a critical component of the Fc-epsilon-RI signaling, were defective in Gab2 $-/-$ mast cells. Gu et al. (2001) concluded that GAB2 is the principal activator of PI3K in response to Fc-epsilon-RI activation, thereby providing genetic evidence that Dos/Gab family scaffolds regulate the PI3K pathway in vivo.

[5422] It is appreciated that the abovementioned animal model for GAB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

- [5423] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [5424] Gu, H.; Saito, K.; Klamman, L. D.; Shen, J.; Fleming, T.; Wang, Y.-P.; Pratt, J. C.; Lin, G.; Lim, B.; Kinet, J.-P.; Neel, B. G. : Essential role for Gab2 in the allergic response. *Nature* 412: 186–190, 2001. ; and
- [5425] Zhao, C.; Yu, D.-H.; Shen, R.; Feng, G.-S. : Gab2, a new pleckstrin homology domain-containing adapter protein, acts to uncouple signaling from ERK kinase to Elk-1. *J. Biol. Chem.* 274.
- [5426] Further studies establishing the function and utilities of GAB2 are found in John Hopkins OMIM database record ID 606203, and in cited publications numbered 212, 156 and 1813 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MADS Box Transcription Enhancer Factor 2, Polypeptide D (myocyte enhancer factor 2D) (MEF2D, Accession XM_173049) is another VGAM181 host target gene. MEF2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MEF2D BINDING SITE, designated SEQ ID:3721, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5427] Another function of VGAM181 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide D (myocyte enhancer factor 2D) (MEF2D, Accession XM_173049), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2D. The function of MEF2D has been established by previous studies. The MEF2 family of regulatory proteins are, like the myogenic basic helix-loop-helix proteins (see OMIM Ref. No. 159970), involved in myogenesis; see (OMIM Ref. No. 600660). Breitbart et al. (1993) obtained MEF2D cDNAs from an adult cardiac ventricle expression library screened at low stringency with a human MEF2B probe. One of the cDNAs encoded a 521-amino acid protein with highly conserved MADS and MEF2 domains. The recombinantly expressed MEF2D protein showed DNA binding to the MEF2 site. Breitbart et al. (1993) found that MEF2D occurs as several alternatively spliced transcripts, one of

which resembles the *Xenopus* SRF-related factor SL-1.

Unlike the other MEF2 family members, MEF2D is present in undifferentiated myoblasts and may participate in the earliest stages of commitment. Hobson et al. (1995)

mapped the MEF2D gene to 1q12-q23 using somatic cell hybrid panel DNAs containing deletion or derivative chromosomes. Mouse Mef2D was mapped by Martin et al.

(1994) to chromosome 3. Ikeshima et al. (1995) demonstrated strong expression of MEF2D in the cerebellum and cerebrum of developing mouse brains and also in central nervous system neurons of adult mice, suggesting that it may be involved in the differentiation of neurogenic as well as myogenic cells.

[5428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5429] Hobson, G. M.; Krahe, R.; Garcia, E.; Siciliano, M. J.; Funanage, V. L. : Regional chromosomal assignments for four members of the MADS domain transcription enhancer factor 2 (MEF2) gene family to human chromosomes 15q26, 19p12, 5q14, and 1q12-q23. *Genomics* 29: 704-711, 1995. ; and

Expression of a MADS box gene, MEF2D, in neurons of the mouse central nervous system: implication of its binary function in m.

[5431] Further studies establishing the function and utilities of MEF2D are found in John Hopkins OMIM database record ID 600663, and in cited publications numbered 1888–1889, 186 and 1891 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. NEBL (Accession NM_006393) is another VGAM181 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:1294, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5432] Another function of VGAM181 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL. Proprotein Convertase Subtilisin/kexin Type 1 (PCSK1, Ac-

cession NM_000439) is another VGAM181 host target gene. PCSK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCSK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK1 BINDING SITE, designated SEQ ID:743, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5433] Another function of VGAM181 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 1 (PCSK1, Accession NM_000439), a gene which processes hormone precursors by cleaving paired basic amino acids; serine protease of the subtilase family. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK1. The function of PCSK1 has been established by previous studies. A wide variety of biologically important polypeptides including hormones, enzymes, and receptors are initially synthesized as large inactive precursors. To release the active component(s), these precursors must undergo limited proteolysis at pairs of basic residues by specific convertases. There is, for example, a diarginyl-specific

proalbumin convertase (see OMIM Ref. No. comment in 103600). Three mammalian convertases, PC1 (PCSK1; also known as PC3), PC2 (PCSK2; 162151), and furin (OMIM Ref. No. 136950), belonging to the family of serine proteinases of the subtilisin family, are prohormone and pro-protein convertases. PC1 and PC2, known also as NEC1 and NEC2 (for neuroendocrine convertase 1 and 2, respectively), differentially cleave proopiomelanocortin (POMC; 176830). Proinsulin is converted to insulin (OMIM Ref. No. 176730) by the concerted action of PC2 and PC3. Furin is a specific proteinase capable of activating the beta subunit of pro-NGF (OMIM Ref. No. 162030) and von Willebrand factor (OMIM Ref. No. 193400). By in situ hybridization, Seidah et al. (1991) mapped NEC1 to human 5q15-q21 and to mouse chromosome 13. Copeland et al. (1992) refined the regional localization on mouse chromosome 13. Ohagi et al. (1996) stated that PC2 is responsible for cleavage of the C-peptide/A-chain junction of the proinsulin molecule, whereas PC3 cleaves the proinsulin molecule on the C-terminal side of the dibasic peptide, arg31-arg32, joining the B-chain and C-peptide. PC3 plays a key role in regulating insulin biosynthesis by initiating the sequential processing. Expression of insulin

and PC3, but not PC2, is coordinately regulated by glucose, consistent with the important role of PC3 in regulating proinsulin processing. Noninsulin-dependent diabetes mellitus (NIDDM; 125853) is associated with increased secretion of proinsulin and proinsulin-like molecules, suggesting that mutations in the PC3 gene may be involved in the development of this disorder. Ohagi et al. (1996) showed that the human PC3 gene consists of 14 exons spanning more than 35 kb. The exon/intron organization of the PC2 and PC3 genes are conserved, consistent with a common evolutionary origin. Screening for mutations in the PC3 gene in Japanese subjects with NIDDM using SSCP analysis and nucleotide sequencing of the entire coding region, Ohagi et al. (1996) could find no mutation associated with NIDDM. A mutation in carboxypeptidase E (CPE; 114855), an enzyme active in the processing and sorting of prohormones, causes obesity in the fat/fat mouse (Naggert et al., 1995; Cool et al., 1997). The gene products of CPE and PC1 cooperate in prohormone processing. Mutations in the CPE gene had not been demonstrated in human obesity. However, Jackson et al. (1997) demonstrated mutations in the prohormone convertase 1 gene, which acts proximally to CPE in the pathway of posttrans-

lational processing of prohormones and neuropeptides.

The subject was a 43-year-old woman with extreme childhood obesity, abnormal glucose homeostasis, hypogonadotropic hypogonadism, hypocortisolism, and elevated plasma proinsulin and POMC concentrations, but very low insulin levels, all suggestive of defective prohormone processing by the patient's PC1. The patient had been described clinically by O'Rahilly et al. (1995); see 600955.

The patient was found to be a compound heterozygote for mutations in PC1. Heteroallelism of the patient was confirmed by the fact that 1 substitution (162150.0001) was found in 3 of the proband's 4 children, all of whom were clinically unaffected; the fourth child had the other mutation, a splice site defect (162150.0002). The proband's fasting serum leptin (OMIM Ref. No. 164160) concentration was appropriate for her body mass index. There was a close similarity of phenotype between the proband and the fat/fat mouse.

[5434] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5435] Ohagi, S.; Sakaguchi, H.; Sanke, T.; Tatsuta, H.; Hanabusa, T.; Nanjo, K. : Human prohormone convertase 3 gene:

exon-intron organization and molecular scanning for mutations in Japanese subjects with NIDDM. Diabetes 45: 897-901, 1996. ; and

[5436] O'Rahilly, S.; Gray, H.; Humphreys, P. J.; Krook, A.; Polonsky, K. S.; White, A.; Gibson, S.; Taylor, K.; Carr, C. : Brief report: impaired processing of prohormones associated with abno.

[5437] Further studies establishing the function and utilities of PCSK1 are found in John Hopkins OMIM database record ID 162150, and in cited publications numbered 362, 844-41 and 846 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase, CAMP-dependent, Regulatory, Type II, Beta (PRKAR2B, Accession NM_002736) is another VGAM181 host target gene. PRKAR2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAR2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR2B BINDING SITE, designated SEQ ID:951, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5438] Another function of VGAM181 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type II, Beta (PRKAR2B, Accession NM_002736), a gene which type II regulatory chains mediate membrane association by binding to anchoring proteins, including the map2 kinase. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR2B. The function of PRKAR2B has been established by previous studies. Using both a rat skeletal muscle clone and a human clone of type II regulatory subunit of cyclic AMP-dependent protein kinase, Scambler et al. (1987) demonstrated that the human gene is located on chromosome 7, close to but separate from the cystic fibrosis locus (OMIM Ref. No. 219700). These conclusions were based on Southern blot analysis of DNA from hybrid cell lines containing only chromosome 7 or parts thereof, as well as human/mouse hybrid cell lines established by means of chromosome-mediated gene transfer (CMGT) using MET (OMIM Ref. No. 164860) as a dominant selectable marker. Independence of PKR2 from CF was also indicated by family linkage studies using a RFLP of the PKR2 probe. Wainwright et al. (1987) showed that PKR2 is linked to several markers on 7q. The closest and strongest

linkage was to TCRB (OMIM Ref. No. 186930), which showed a maximum lod score of 3.01 at $\theta = 0.00$. Using RFLPs in the CEPH panel of 40 families, Solberg et al. (1992) mapped the regulatory subunit RII-beta of cAMP-dependent protein kinase to 7q. They constructed a 7-point framework map including PRKAR2B and demonstrated the following order: cen--D7S371--(COL1A2, D7S79)--PRKAR2B--MET--D7S87--TCRB--qter. Furthermore, by in situ hybridization to metaphase chromosomes, Solberg et al. (1992) physically mapped PRKAR2B to 7q22. Cummings et al. (1996) generated knockout mice for the cyclic AMP dependent protein kinase regulatory subunit type II-beta (designated RII-beta by them). They reported that the mutants appeared healthy but had markedly diminished white adipose tissue despite normal food intake and were protected against developing diet-induced obesity and fatty livers. In the mutant mice, brown adipose tissue demonstrated a compensatory increase in RI-alpha (OMIM Ref. No. 188830). Cummings et al. (1996) reported that RII-beta mutants exhibited markedly reduced leptin (OMIM Ref. No. 164160) mRNA and plasma levels; however, only mild hyperphagia was present

- [5439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [5440] Cummings, D. E.; Brandon, E. P.; Planas, J. V.; Motamed, K.; Idzerda, R. L.; McKnight, G. S. : Genetically lean mice result from targeted disruption of the RII-beta subunit of protein kinase A. *Nature* 382: :622–626, 1996. ; and

- [5442] Further studies establishing the function and utilities of PRKAR2B are found in John Hopkins OMIM database record ID 176912, and in cited publications numbered 282–283, 28 and 284 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Secretoglobin, Family 3A, Member 2 (SCGB3A2, Accession NM_054023) is another VGAM181 host target gene. SCGB3A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCGB3A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of SCGB3A2 BINDING SITE, designated SEQ ID:2361, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5443] Another function of VGAM181 is therefore inhibition of Secretoglobin, Family 3A, Member 2 (SCGB3A2, Accession NM_054023), a gene which is a uteroglobin-related protein and is a downstream target of TITF1. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCGB3A2. The function of SCGB3A2 has been established by previous studies. In addition to regulating thyroid-specific expression of genes, thyroid transcription factor (TITF1; 600635) controls the transcription of genes specifically expressed in lung, such as surfactant proteins (e.g., SFTPA1; 178630) and uteroglobin (UGB; 192020). Mice lacking Ttf1 die immediately after birth from respiratory failure caused by profoundly hypoplastic lungs (Kimura et al., 1996). The UGRP1 gene encodes a uteroglobin-related protein and is a downstream target of TITF1. Niimi et al. (2002) presented evidence that UGRP1 is one of the asthma-susceptibility genes located on 5q31-q32. This homodimeric secretory protein expressed

only in lung and trachea was found to have a G-to-A polymorphism at -112 bp in the gene promoter region. The -112A allele is responsible for a 24% reduction in the promoter activity in relation to the -112G allele, as examined by transfection analysis. Electrophoretic mobility-shift analysis revealed that an unknown nuclear factor binds to the region around -112 bp. The binding affinity with the -112A oligonucleotide was reduced by approximately one-half, as compared with the -112G oligonucleotide. In a case-control study using 169 Japanese individuals (84 patients with asthma and 85 health control individuals), those with the -112A allele (G/A or A/A) were 4.1 times more likely to have asthma than were those with the wildtype allele (G/G).

[5444] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5445] Niimi, T.; Munakata, M.; Keck-Waggoner, C. L.; Popescu, N. C.; Levitt, R. C.; Hisada, M.; Kimura, S. : A polymorphism in the human UGRP1 gene promoter that regulates transcription is associated with an increased risk of asthma. *Am. J. Hum. Genet.* 70: 718-725, 2002. ; and

Levitt, R. C.; Kimura, S. : UGRP1, a uteroglobin/Clara cell secretory protein-related protein, is a novel lung-enriched downst.

[5447] Further studies establishing the function and utilities of SCGB3A2 are found in John Hopkins OMIM database record ID 606531, and in cited publications numbered 1627-177 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SMP1 (Accession NM_014313) is another VGAM181 host target gene. SMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMP1 BINDING SITE, designated SEQ ID:1490, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5448] Another function of VGAM181 is therefore inhibition of SMP1 (Accession NM_014313), a gene which is a potential integral membrane protein. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMP1. The function of SMP1 has been established by previous stud-

ies. Wagner and Flegel (2000) found that the RH cluster on chromosome 1p contains 3 genes: RHD (OMIM Ref. No. 111680), RHCE (OMIM Ref. No. 111700), and SMP1. They noted that the nucleotide sequence of SMP1 had been deposited in GenBank (AF091282) as encoding a putative 157-amino acid member of an 18-kD small membrane protein family and that the gene shows homology to an open reading frame on chromosome 21 (Reboul et al., 1999). The position of the gene between both RH genes implies that any polymorphism of the SMP1 gene would be tightly linked to a specific RH haplotype. The authors suggested that functionally relevant mutations of the SMP1 gene may cause selection pressure for or against specific RH haplotypes. Such factors might explain some previously unresolved issues of RH haplotype distribution, such as the high frequency of RH-negativity in the European population.

[5449] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5450] Reboul, J.; Gardiner, K.; Monneron, D.; Uze, G.; Lutfalla, G. : Comparative genomic analysis of the interferon/interleukin-10 receptor gene cluster. *Genome Res.* 9:

242–250, 1999. ; and

[5451] Wagner, F. F.; Flegel, W. A. : RHD gene deletion occurred in the Rhesus box. Blood 95: 3662–3668, 2000.

[5452] Further studies establishing the function and utilities of SMP1 are found in John Hopkins OMIM database record ID 605348, and in cited publications numbered 1440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM181 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:1147, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5453] Another function of VGAM181 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM181 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM97. Transforming Growth Factor, Alpha (TGFA, Accession NM_003236) is another VGAM181 host target gene. TGFA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:1001, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5454] Another function of VGAM181 is therefore inhibition of Transforming Growth Factor, Alpha (TGFA, Accession NM_003236), a gene which is able to bind to the egf receptor and to act synergistically with tgfbeta to promote anchorage-independent cell proliferation in soft agar. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA. The function of TGFA has been estab-

lished by previous studies. Ellis et al. (1987) presented evidence that TGFA plays a role in certain paraneoplastic manifestations of melanoma: the sign of Leser–Trelat (the sudden appearance of, or increase in the number and size of, seborrheic keratoses), acanthosis nigricans, and eruptive acrochordons (sudden onset of multiple skin tags). Fernandez–Larrea et al. (1999) used the 2–hybrid screen to identify pro–TGF–alpha cytoplasmic domain–binding proteins, which they referred to as TACIPs (pro–TGF–alpha cytoplasmic domain–interacting proteins), involved in the trafficking of pro–TGF–alpha. They cloned 2 such proteins, which they designated TACIP1 (OMIM Ref. No. 601017) and TACIP18 (OMIM Ref. No. 602217). The circadian clock in the suprachiasmatic nucleus is thought to drive daily rhythms of behavior by secreting factors that act locally within the hypothalamus. In a systematic screen, Kramer et al. (2001) identified TGFA as a likely suprachiasmatic nucleus inhibitor of locomotion. TGFA is expressed rhythmically in the suprachiasmatic nucleus, and when infused into the third ventricle it reversibly inhibited locomotor activity and disrupted circadian sleep–wake cycles. These actions were mediated by EGF receptors on neurons in the hypothalamic subparaventricular

zone. Mice with a hypomorphic EGF receptor mutation exhibited excessive daytime locomotor activity and failed to suppress activity when exposed to light. Kramer et al. (2001) concluded that their results implicate EGF receptor signaling in the daily control of locomotor activity. They identified a neural circuit in the hypothalamus that likely mediates the regulation of behavior both by the suprachiasmatic nucleus and the retina using TGFA and EGF receptors in the retinohypothalamic tract.

[5455] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5456] Fernandez-Larrea, J.; Merlos-Suarez, A.; Urena, J. M.; Baselga, J.; Arribas, J. : A role for a PDZ protein in the early secretory pathway for the targeting of proTGF- α to the cell surface. *Molec. Cell* 3: 423–433, 1999. ; and

[5457] Kramer, A.; Yang, F.-C.; Snodgrass, P.; Li, X.; Scammell, T. E.; Davis, F. C.; Weitz, C. J. : Regulation of daily locomotor activity and sleep by hypothalamic EGF receptor signaling. *S.*

[5458] Further studies establishing the function and utilities of TGFA are found in John Hopkins OMIM database record ID 190170, and in cited publications numbered 616–620, 7

and 621–623 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Acetyl–Coenzyme A Acyltransferase 2 (mitochondrial 3–oxoacyl–Coenzyme A thiolase) (ACAA2, Accession XM_166287) is another VGAM181 host target gene. ACAA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ACAA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACAA2 BINDING SITE, designated SEQ ID:3540, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5459] Another function of VGAM181 is therefore inhibition of Acetyl–Coenzyme A Acyltransferase 2 (mitochondrial 3–oxoacyl–Coenzyme A thiolase) (ACAA2, Accession XM_166287). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACAA2. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172) is another VGAM181 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3` un–

translated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:2576, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5460] Another function of VGAM181 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549) is another VGAM181 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:1310, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5461] Another function of VGAM181 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. FLJ10849 (Accession NM_018243) is another VGAM181 host target gene. FLJ10849 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10849, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10849 BINDING SITE, designated SEQ ID:1803, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5462] Another function of VGAM181 is therefore inhibition of FLJ10849 (Accession NM_018243). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10849. FLJ13262 (Accession NM_024914) is another VGAM181 host target gene. FLJ13262 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13262, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13262 BINDING SITE, designated SEQ ID:2112, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5463] Another function of VGAM181 is therefore inhibition of FLJ13262 (Accession NM_024914). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13262. FLJ21977 (Accession NM_032213) is another VGAM181 host target gene. FLJ21977 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21977 BINDING SITE, designated SEQ ID:2237, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5464] Another function of VGAM181 is therefore inhibition of FLJ21977 (Accession NM_032213). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ21977. FLJ22301 (Accession NM_024836) is another VGAM181 host target gene. FLJ22301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22301 BINDING SITE, designated SEQ ID:2095, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5465] Another function of VGAM181 is therefore inhibition of FLJ22301 (Accession NM_024836). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22301. Hect (homologous to the E6-AP (UBE3A) Carboxyl Terminus) Domain and RCC1 (CHC1)-like Domain (RLD) 1 (HERC1, Accession NM_003922) is another VGAM181 host target gene. HERC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HERC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of HERC1 BINDING SITE, designated SEQ ID:1071, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5466] Another function of VGAM181 is therefore inhibition of Hect (homologous to the E6-AP (UBE3A) Carboxyl Terminus) Domain and RCC1 (CHC1)-like Domain (RLD) 1 (HERC1, Accession NM_003922). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HERC1. KIAA0280 (Accession XM_166238) is another VGAM181 host target gene. KIAA0280 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0280 BINDING SITE, designated SEQ ID:3536, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5467] Another function of VGAM181 is therefore inhibition of KIAA0280 (Accession XM_166238). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0280. KIAA0391 (Accession NM_014672) is another VGAM181 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:1517, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5468] Another function of VGAM181 is therefore inhibition of KIAA0391 (Accession NM_014672). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. PRO1386 (Accession NM_031269) is another VGAM181 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1386 BINDING SITE, designated SEQ ID:2188, to the nucleotide

sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5469] Another function of VGAM181 is therefore inhibition of PRO1386 (Accession NM_031269). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1386. RNA Binding Motif, Single Stranded Interacting Protein 1 (RBMS1, Accession NM_016837) is another VGAM181 host target gene. RBMS1 BINDING SITE1 through RBMS1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RBMS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBMS1 BINDING SITE1 through RBMS1 BINDING SITE4, designated SEQ ID:1711, SEQ ID:1712, SEQ ID:1713 and SEQ ID:970 respectively, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5470] Another function of VGAM181 is therefore inhibition of RNA Binding Motif, Single Stranded Interacting Protein 1 (RBMS1, Accession NM_016837). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with RBMS1. SGP28 (Accession NM_006061) is another VGAM181 host target gene. SGP28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGP28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGP28 BINDING SITE, designated SEQ ID:1270, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5471] Another function of VGAM181 is therefore inhibition of SGP28 (Accession NM_006061). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGP28. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_017744) is another VGAM181 host target gene. ST7L BINDING SITE1 through ST7L BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE1

through ST7L BINDING SITE3, designated SEQ ID:1746, SEQ ID:2456 and SEQ ID:2475 respectively, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5472] Another function of VGAM181 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_017744). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. LOC157507 (Accession XM_088312) is another VGAM181 host target gene. LOC157507 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:3202, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5473] Another function of VGAM181 is therefore inhibition of LOC157507 (Accession XM_088312). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157507. LOC158158 (Accession XM_088494) is another VGAM181 host target gene. LOC158158 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158158 BINDING SITE, designated SEQ ID:3211, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5474] Another function of VGAM181 is therefore inhibition of LOC158158 (Accession XM_088494). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158158. LOC219730 (Accession XM_167580) is another VGAM181 host target gene. LOC219730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219730 BINDING SITE, designated SEQ ID:3588, to the nucleotide sequence of VGAM181 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:516.

[5475] Another function of VGAM181 is therefore inhibition of LOC219730 (Accession XM_167580). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219730. LOC255158 (Accession XM_171213) is another VGAM181 host target gene. LOC255158 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255158 BINDING SITE, designated SEQ ID:3693, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:516.

[5476] Another function of VGAM181 is therefore inhibition of LOC255158 (Accession XM_171213). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 182 (VGAM182) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5477] VGAM182 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM182 was detected is described hereinabove with reference to Figs. 1–8.

[5478] VGAM182 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5479] VGAM182 gene encodes a VGAM182 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM182 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM182 precursor RNA is designated SEQ ID:168, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:168 is located at position 96777 relative to the genome of Vaccinia Virus.

[5480] VGAM182 precursor RNA folds onto itself, forming

VGAM182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5481] An enzyme complex designated DICER COMPLEX, `dices` the VGAM182 folded precursor RNA into VGAM182 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM182 RNA is designated SEQ ID:517, and is provided hereinbelow with reference to the sequence listing part.

[5482] VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM182 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5483] VGAM182 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM182 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM182 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5484] The complementary binding of VGAM182 RNA, herein designated VGAM RNA, to host target binding sites on VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM182 host target RNA into VGAM182 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5485] It is appreciated that VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM182 host target genes. The mRNA of each one of this plurality of VGAM182 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM182 RNA, herein designated VGAM RNA, and which when bound by VGAM182 RNA causes inhibition of translation of respective one or more VGAM182 host target proteins.

[5486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM182 gene, herein designated VGAM GENE, on one or more VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5487] It is yet further appreciated that a function of VGAM182 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM182 correlate with, and may be deduced from, the identity of the host target genes which VGAM182 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[5488] Nucleotide sequences of the VGAM182 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM182 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM182 are further described hereinbelow with reference to Table 1.

[5489] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM182 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM182 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5490] As mentioned hereinabove with reference to Fig. 1, a function of VGAM182 gene, herein designated VGAM is inhibition of expression of VGAM182 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM182 correlate with, and may be deduced from, the identity of the target genes which VGAM182 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[5491] Protein Tyrosine Phosphatase, Receptor Type, M (PTPRM, Accession NM_002845) is a VGAM182 host target gene. PTPRM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRM BINDING SITE, designated SEQ ID:963, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:517.

[5492] A function of VGAM182 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, M (PTPRM, Accession NM_002845). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRM. HCA4 (Accession NM_138704) is another VGAM182 host target gene. HCA4 BINDING SITE1 and HCA4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HCA4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE1

and HCA4 BINDING SITE2, designated SEQ ID:2450 and SEQ ID:3086 respectively, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:517.

[5493] Another function of VGAM182 is therefore inhibition of HCA4 (Accession NM_138704). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. HDAC9-PENDING (Accession NM_014707) is another VGAM183 host target gene. HDAC9-PENDING BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC9-PENDING, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC9-PENDING BINDING SITE, designated SEQ ID:1527, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:518.

[5494] Another function of VGAM183 is therefore inhibition of HDAC9-PENDING (Accession NM_014707). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with HDAC9-PENDING. KIAA0232 (Accession XM_052627) is another VGAM183 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:2958, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:518.

[5495] Another function of VGAM183 is therefore inhibition of KIAA0232 (Accession XM_052627). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. KIAA1010 (Accession XM_050742) is another VGAM183 host target gene. KIAA1010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1010 BINDING SITE, designated SEQ ID:2933, to the nucleotide sequence of VGAM183 RNA, herein designated

VGAM RNA, also designated SEQ ID:518.

[5496] Another function of VGAM183 is therefore inhibition of KIAA1010 (Accession XM_050742). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1010. LOC219894 (Accession XM_167782) is another VGAM183 host target gene. LOC219894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:3596, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:518.

[5497] Another function of VGAM183 is therefore inhibition of LOC219894 (Accession XM_167782). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 184 (VGAM184) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5498] VGAM184 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM184 was detected is described hereinabove with reference to Figs. 1–8.

[5499] VGAM184 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5500] VGAM184 gene encodes a VGAM184 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM184 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM184 precursor RNA is designated SEQ ID:170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:170 is located at position 95224 relative to the genome of Vaccinia Virus.

[5501] VGAM184 precursor RNA folds onto itself, forming

VGAM184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5502] An enzyme complex designated DICER COMPLEX, `dices` the VGAM184 folded precursor RNA into VGAM184 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM184 RNA is designated SEQ ID:519, and is provided hereinbelow with reference to the sequence listing part.

[5503] VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM184 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5504] VGAM184 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM184 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM184 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5505] The complementary binding of VGAM184 RNA, herein designated VGAM RNA, to host target binding sites on VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM184 host target RNA into VGAM184 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5506] It is appreciated that VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM184 host target genes. The mRNA of each one of this plurality of VGAM184 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM184 RNA, herein designated VGAM RNA, and which when bound by VGAM184 RNA causes inhibition of translation of respective one or more VGAM184 host target proteins.

[5507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM184 gene, herein designated VGAM GENE, on one or more VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5508] It is yet further appreciated that a function of VGAM184 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM184 correlate with, and may be deduced from, the identity of the host target genes which VGAM184 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[5509] Nucleotide sequences of the VGAM184 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM184 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM184 are further described hereinbelow with reference to Table 1.

[5510] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM184 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM184 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5511] As mentioned hereinabove with reference to Fig. 1, a function of VGAM184 gene, herein designated VGAM is inhibition of expression of VGAM184 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM184 correlate with, and may be deduced from, the identity of the target genes which VGAM184 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[5512] poly(A) Binding Protein, Cytoplasmic 4 (inducible form) (PABPC4, Accession NM_003819) is a VGAM184 host target gene. PABPC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PABPC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPC4 BINDING SITE, designated SEQ ID:1064, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:519.

[5513] A function of VGAM184 is therefore inhibition of poly(A) Binding Protein, Cytoplasmic 4 (inducible form) (PABPC4, Accession NM_003819), a gene which involves in cytoplasmic regulatory processes of mRNA metabolism. Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPC4. The function of PABPC4 has been established by previous studies. PABPs bind to the poly(A) tail present at the 3-prime ends of most eukaryotic mRNAs. Yang et al. (1995) isolated an activation-induced T-cell mRNA encoding a protein similar to PABPC1. The pre-

dicted 644-amino acid protein, which they designated iPABP (inducible PABP), shares 79% sequence identity with PABPC1. Both proteins contain 4 RNA-binding domains and proline-rich C termini, and both have very similar RNA-binding properties. Using immunofluorescence, Yang et al. (1995) determined that iPABP localizes primarily to the cytoplasm. Northern blot analysis revealed that iPABP was expressed as a 3.2-kb mRNA in all tissues tested. Activation of T cells increased iPABP mRNA levels in T cells approximately 5-fold. The authors suggested that iPABP might be necessary for regulation of stability of labile mRNA species in activated T cells. Platelets are activated in response to vascular injury. Activated platelets express molecules that execute many of the complex cellular biochemical processes that staunch the loss of blood and begin the process of vascular repair. Hough et al. (1997) identified iPABP as an antigen, APP1 (activated-platelet protein-1), expressed on thrombin-activated rabbit platelets. They isolated rabbit and human APP1 cDNAs. The predicted human and rabbit proteins are 99% identical. Hough et al. (1997) stated that, given its similarity to PABPC1, APP1 may be involved in the regulation of protein translation in platelets and megakaryocytes or may partic-

ipate in the binding or stabilization of polyadenylates in platelet dense granules.

[5514] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5515] Yang, H.; Duckett, C. S.; Lindsten, T. : iPABP, an inducible poly(A)-binding protein detected in activated human T cells. *Molec. Cell. Biol.* 15: 6770-6776, 1995. ; and

[5516] Houn, A. K.; Maggini, L.; Clement, C. Y.; Reed, G. L. : Identification and structure of activated-platelet protein-1, a protein with RNA-binding domain motifs that is expressed by activ.

[5517] Further studies establishing the function and utilities of PABPC4 are found in John Hopkins OMIM database record ID 603407, and in cited publications numbered 1205-1207 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SH3-domain GRB2-like 2 (SH3GL2, Accession NM_003026) is another VGAM184 host target gene. SH3GL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3GL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL2 BINDING SITE, designated SEQ ID:983, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:519.

[5518] Another function of VGAM184 is therefore inhibition of SH3-domain GRB2-like 2 (SH3GL2, Accession NM_003026), a gene which plays a role in synaptic vesicle recycling, in particular in clathrin-mediated vesicle endocytosis. Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL2. The function of SH3GL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM84.IMP-2 (Accession NM_006548) is another VGAM184 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:1309, to the nucleotide sequence of VGAM184 RNA,

herein designated VGAM RNA, also designated SEQ ID:519.

[5519] Another function of VGAM184 is therefore inhibition of IMP-2 (Accession NM_006548). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. KIAA0872 (Accession NM_014940) is another VGAM184 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:1593, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:519.

[5520] Another function of VGAM184 is therefore inhibition of KIAA0872 (Accession NM_014940). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. MGC19570 (Accession NM_145063) is another VGAM184 host target gene. MGC19570 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by MGC19570, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19570 BINDING SITE, designated SEQ ID:2514, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:519.

[5521] Another function of VGAM184 is therefore inhibition of MGC19570 (Accession NM_145063). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC19570. Protein Tyrosine Phosphatase, Non-receptor Type 4 (megakaryocyte) (PTPN4, Accession NM_002830) is another VGAM184 host target gene. PTPN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN4 BINDING SITE, designated SEQ ID:961, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:519.

[5522] Another function of VGAM184 is therefore inhibition of

Protein Tyrosine Phosphatase, Non-receptor Type 4 (megakaryocyte) (PTPN4, Accession NM_002830). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN4. Triple Homeobox 1 (TIX1, Accession XM_029734) is another VGAM184 host target gene. TIX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:2604, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:519.

[5523] Another function of VGAM184 is therefore inhibition of Triple Homeobox 1 (TIX1, Accession XM_029734). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIX1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 185 (VGAM185) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[5524] VGAM185 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM185 was detected is described hereinabove with reference to Figs. 1–8.

[5525] VGAM185 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM185 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5526] VGAM185 gene encodes a VGAM185 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM185 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM185 precursor RNA is designated SEQ ID:171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:171 is located at position 97665 relative to the genome of Vaccinia Virus.

[5527] VGAM185 precursor RNA folds onto itself, forming VGAM185 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[5528] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM185 folded precursor RNA into VGAM185 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 92%) nucleotide se-
quence of VGAM185 RNA is designated SEQ ID:520, and is
provided hereinbelow with reference to the sequence list-
ing part.

[5529] VGAM185 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM185 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM185 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5530] VGAM185 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM185 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM185 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM185 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM185 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5531] The complementary binding of VGAM185 RNA, herein designated VGAM RNA, to host target binding sites on VGAM185 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM185 host target RNA into VGAM185 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5532] It is appreciated that VGAM185 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM185 host target genes. The mRNA of each one of this plurality of VGAM185 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM185 RNA, herein designated VGAM RNA, and which when bound by VGAM185 RNA causes inhibition of translation of respective one or more VGAM185 host target proteins.

[5533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM185 gene, herein designated VGAM GENE, on one or more VGAM185 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5534] It is yet further appreciated that a function of VGAM185 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM185 correlate with, and may be deduced from, the identity of the host target genes which VGAM185 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [5535] Nucleotide sequences of the VGAM185 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM185 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM185 are further described hereinbelow with reference to Table 1.
- [5536] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM185 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM185 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [5537] As mentioned hereinabove with reference to Fig. 1, a function of VGAM185 gene, herein designated VGAM is inhibition of expression of VGAM185 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM185 correlate with, and may be deduced from, the identity of the target genes which VGAM185 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5538] Pregnancy Specific Beta-1-glycoprotein 5 (PSG5, Accession NM_002781) is a VGAM185 host target gene. PSG5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSG5 BINDING SITE, designated SEQ ID:955, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:520.

[5539] A function of VGAM185 is therefore inhibition of Pregnancy Specific Beta-1-glycoprotein 5 (PSG5, Accession NM_002781), a gene which is a member of the pregnancy-specific glycoprotein (PSG) and CEA families. Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG5. The function of PSG5 has been established by previous studies. The human pregnancy-specific glycoproteins (PSGs) are a group of molecules that are mainly produced by the placental syncytiotrophoblasts during pregnancy. PSGs comprise a subgroup of the carcinoembryonic antigen (CEA) family, which belongs to the immunoglobulin superfamily. See PSG3 (OMIM Ref. No.

176392) for additional information about PSGs. Teglund et al. (1994) found that the PSG5 gene contains 6 exons. Studies by several groups resulted in the mapping of the CEA gene family to 19q13.1–q13.2 (Thompson et al., 1990; Thompson et al., 1992; Tynan et al., 1992; Trask et al., 1993). The PSG subgroup is located telomeric of the CEA subgroup, and together they span approximately 1.1 to 1.2 Mb (Brandriff et al., 1992; Tynan et al., 1992). Using a high-resolution restriction fragment fingerprinting technique, Olsen et al. (1994) assembled 256 cosmids spanning the PSG region on 19q13.2 into a single 700-kb contig. FISH to sperm pronuclei and cosmid walking experiments indicated that this PSG contig is telomeric of CGM8 at the telomeric end of the CEA subgroup gene cluster. Detailed restriction mapping and hybridization with gene-specific probes indicated that the order of the 11 PSG genes in the contig is cen--PSG3--PSG8 (OMIM Ref. No. 176397)--PSG12 (PSG10; 176399)--PSG1 (OMIM Ref. No. 176390)--PSG6 (OMIM Ref. No. 176395)--PSG7 (OMIM Ref. No. 176396)--PSG13 (PSG11; 176401)--PSG2 (OMIM Ref. No. 176391)--PSG5--PSG4 (OMIM Ref. No. 176393)--PSG11 (PSG9; 176398)--tel. The PSG genes are tandemly oriented in a 5-prime to 3-prime direction from

telomere to centromere. The CEA subgroup gene CGM11 is located at the telomeric end of the PSG gene cluster, and 6 genes belonging to a third CEA family subgroup, namely CGM13 through CGM18 (later OMIM Ref. No. 109770), are interspersed among the PSG genes. Nomenclature: Beauchemin et al. (1999) provided a revised nomenclature for the CEA gene family. Based on this nomenclature, the CEA family is composed of the PSG subfamily, the CEACAM subfamily (see OMIM Ref. No. 109770), and the CEACAM pseudogene (CEACAMP) subfamily (see OMIM Ref. No. 109770). PSG11, PSG12, and PSG13 were renamed PSG9, PSG10, and PSG11, respectively.

[5540] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5541] Beauchemin, N.; Draber, P.; Dveksler, G.; Gold, P.; Gray-Owen, S.; Grunert, F.; Hammarstrom, S.; Holmes, K. V.; Karlsson, A.; Kuroki, M.; Lin, S.-H.; Lucka, L.; and 13 others : Redefined nomenclature for members of the carcinoembryonic antigen family. *Exp. Cell Res.* 252: 243-249, 1999. ; and

[5542] Brandriff, B. F.; Gordon, L. A.; Tynan, K. T.; Olsen, A. S.;

Mohrenweiser, H. W.; Fertitta, A.; Carrano, A. V.; Trask, B. J. : Order and genomic distances among members of the carcinoem.

[5543] Further studies establishing the function and utilities of PSG5 are found in John Hopkins OMIM database record ID 176394, and in cited publications numbered 503, 2456, 2467–2465, 246 and 2469 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FAPP2 (Accession NM_032639) is another VGAM185 host target gene. FAPP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FAPP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAPP2 BINDING SITE, designated SEQ ID:2267, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:520.

[5544] Another function of VGAM185 is therefore inhibition of FAPP2 (Accession NM_032639). Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAPP2. LOC145820 (Accession XM_085246) is another VGAM185

host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:3084, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:520.

[5545] Another function of VGAM185 is therefore inhibition of LOC145820 (Accession XM_085246). Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145820. LOC83690 (Accession NM_031461) is another VGAM185 host target gene. LOC83690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83690 BINDING SITE, designated SEQ ID:2202, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:520.

[5546] Another function of VGAM185 is therefore inhibition of LOC83690 (Accession NM_031461). Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83690. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 186 (VGAM186) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5547] VGAM186 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM186 was detected is described hereinabove with reference to Figs. 1–8.

[5548] VGAM186 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM186 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5549] VGAM186 gene encodes a VGAM186 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM186

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM186 precursor RNA is designated SEQ ID:172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:172 is located at position 99100 relative to the genome of Vaccinia Virus.

[5550] VGAM186 precursor RNA folds onto itself, forming VGAM186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5551] An enzyme complex designated DICER COMPLEX, `dices` the VGAM186 folded precursor RNA into VGAM186 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 94%) nucleotide sequence of VGAM186 RNA is designated SEQ ID:521, and is provided hereinbelow with reference to the sequence listing part.

[5552] VGAM186 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM186 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM186 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5553] VGAM186 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM186 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM186 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM186 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM186 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5554] The complementary binding of VGAM186 RNA, herein designated VGAM RNA, to host target binding sites on VGAM186 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM186 host target RNA into VGAM186 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5555] It is appreciated that VGAM186 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM186 host target genes. The mRNA of each one of this plurality of VGAM186 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM186 RNA, herein designated VGAM RNA, and which when bound by VGAM186 RNA causes inhibition of translation of respective one or more VGAM186 host target proteins.

[5556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM186 gene, herein designated VGAM GENE, on one or more VGAM186 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5557] It is yet further appreciated that a function of VGAM186 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM186 correlate with, and may be deduced from, the identity of the host target genes which VGAM186 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5558] Nucleotide sequences of the VGAM186 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM186 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM186 are further described hereinbelow with reference to Table 1.

[5559] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM186 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM186 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[5560] As mentioned hereinabove with reference to Fig. 1, a function of VGAM186 gene, herein designated VGAM is inhibition of expression of VGAM186 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM186 correlate with, and may be deduced from, the identity of the target genes which VGAM186 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5561] Insulin-like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618) is a VGAM186 host target gene. IGF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF1 BINDING SITE, designated SEQ ID:762, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:521.

[5562] A function of VGAM186 is therefore inhibition of Insulin-like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618), a gene which are structurally and functionally related to insulin but have a much higher growth-

promoting activity. Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF1. The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM34.FLJ20035 (Accession NM_017631) is another VGAM186 host target gene. FLJ20035 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20035 BINDING SITE, designated SEQ ID:1733, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:521.

[5563] Another function of VGAM186 is therefore inhibition of FLJ20035 (Accession NM_017631). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20035. FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM_021910) is another VGAM186 host target gene. FXYD3 BINDING SITE1 and FXYD3 BINDING

SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FXYD3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD3 BINDING SITE1 and FXYD3 BINDING SITE2, designated SEQ ID:1966 and SEQ ID:1263 respectively, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:521.

[5564] Another function of VGAM186 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM_021910). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 187 (VGAM187) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5565] VGAM187 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM187 was detected is described

hereinabove with reference to Figs. 1–8.

[5566] VGAM187 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5567] VGAM187 gene encodes a VGAM187 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM187 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM187 precursor RNA is designated SEQ ID:173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:173 is located at position 98088 relative to the genome of Vaccinia Virus.

[5568] VGAM187 precursor RNA folds onto itself, forming VGAM187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5569] An enzyme complex designated DICER COMPLEX, `dices` the VGAM187 folded precursor RNA into VGAM187 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM187 RNA is designated SEQ ID:522, and is provided hereinbelow with reference to the sequence listing part.

[5570] VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM187 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM187 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5571] VGAM187 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM187 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM187 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM187 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM187 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5572] The complementary binding of VGAM187 RNA, herein designated VGAM RNA, to host target binding sites on VGAM187 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM187 host target RNA into VGAM187 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5573] It is appreciated that VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM187 host target genes. The mRNA of each one of this plurality of VGAM187 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM187 RNA, herein designated VGAM RNA, and which when bound by VGAM187 RNA causes inhibition of translation of respective one or more VGAM187 host target proteins.

[5574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM187 gene, herein designated VGAM GENE, on one or more VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5575] It is yet further appreciated that a function of VGAM187 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM187 correlate with, and may be deduced from, the identity of the host target genes which VGAM187 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5576] Nucleotide sequences of the VGAM187 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM187 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM187 are further described hereinbelow with reference to Table 1.

[5577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM187 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM187 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5578] As mentioned hereinabove with reference to Fig. 1, a function of VGAM187 gene, herein designated VGAM is inhibition of expression of VGAM187 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM187 correlate with, and may be deduced from, the identity of the target genes which VGAM187 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5579] Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383) is a VGAM187 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:2710, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5580] A function of VGAM187 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383), a gene which Adenylate cyclase (type 2), an ATP-pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Cyclin A1 (CCNA1, Accession NM_003914) is another VGAM187 host target gene. CCNA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNA1 BINDING SITE, designated SEQ ID:1070, to the nucleotide sequence of VGAM187 RNA,

herein designated VGAM RNA, also designated SEQ ID:522.

[5581] Another function of VGAM187 is therefore inhibition of Cyclin A1 (CCNA1, Accession NM_003914), a gene which Cyclin A1; acts as a CDK kinase regulatory subunit that interacts with CDK2; strongly similar to murine Ccna1. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNA1. The function of CCNA1 has been established by previous studies. The kinase activity of the CDK2 (OMIM Ref. No. 116953)–cyclin A complex, which peaks at the G1/S transition of the cell cycle, is required for the cell to enter S phase. Cyclin A also forms a complex with CDC2 (OMIM Ref. No. 116940), whose activity peaks at the G2/M transition, and the kinase activity of CDC2–cyclin A is required for the cell to enter M phase. Xenopus and mouse contain 2 cyclin A genes, cyclin A1 and cyclin A2, the homolog of human cyclin A (CCNA2; 123835). By searching an EST database with a cyclin consensus sequence, Yang et al. (1997) identified a cDNA encoding the human cyclin A1. The predicted 465–amino acid protein shares 84%, 59%, and 48% sequence identity with mouse cyclin A1, Xenopus cyclin A1, and human cy–

clin A, respectively. Northern blot analysis revealed that the 2.1-kb cyclin A1 mRNA was only expressed in testis and brain, with the level of expression in testis being much higher. In addition, the authors detected cyclin A1 mRNA in ML-1 and several other myeloid leukemia cell lines. The expression of cyclin A1 was differentiation- and cell cycle-regulated in ML-1 cells. Cyclin A1 protein had an apparent molecular mass of 65 kD and coimmunoprecipitated with CDK2 and showed histone H1 (see OMIM Ref. No. 142711) kinase activity in ML-1 cell extracts. Muller et al. (1999) reported that the cyclin A1 gene contains 9 exons and spans 13 kb. Cyclin A1 promoter activity depends on 4 GC boxes, and members of the Sp1 (OMIM Ref. No. 189906) family appear to be involved in directing expression of cyclin A1 in both a tissue- and cell cycle-specific manner. Elevated levels of expression of cyclin A1 have been found in several leukemia cell lines and blood samples from patients with hematopoietic malignancies, notably, acute myeloid leukemia. To evaluate whether cyclin A1 is directly involved in the development of myeloid leukemia, Liao et al. (2001) overexpressed mouse cyclin A1 protein in the myeloid lineage of transgenic mice under the direction of the human cathepsin G

(CTSG; 116830) promoter. The resulting transgenic mice exhibited an increased proportion of immature myeloid cells in the peripheral blood, bone marrow, and spleen. The abnormal myelopoiesis developed within a few months after birth and progressed to overt acute myeloid leukemia at a frequency of approximately 15% over the course of 7 to 14 months. Both abnormalities in myelopoiesis and the leukemic state could be transplanted to irradiated SCID (severe combined immunodeficient) mice. The observations suggested that cyclin A1 overexpression results in abnormal myelopoiesis and is necessary, but not sufficient, in the cooperative events inducing the transformed phenotype. The data further supported an important role of cyclin A1 in hematopoiesis and the etiology of myeloid leukemia.

[5582] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5583] Liao, C.; Wang, X. Y.; Wei, H. Q.; Li, S. Q.; Merghoub, T.; Pandolfi, P. P.; Wolgemuth, D. J. : Altered myelopoiesis and the development of acute myeloid leukemia in transgenic mice overexpressing cyclin A1. Proc. Nat. Acad. Sci. 98: 6853–6858, 2001. ; and

[5584] Yang, R.; Morosetti, R.; Koeffler, H. P. : Characterization of a second human cyclin A that is highly expressed in testis and in several leukemic cell lines. Cancer Res. 57: 913–920, 19.

[5585] Further studies establishing the function and utilities of CCNA1 are found in John Hopkins OMIM database record ID 604036, and in cited publications numbered 1870–187 and 1053 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Component of Oligomeric Golgi Complex 6 (COG6, Accession XM_053233) is another VGAM187 host target gene. COG6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COG6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COG6 BINDING SITE, designated SEQ ID:2961, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5586] Another function of VGAM187 is therefore inhibition of Component of Oligomeric Golgi Complex 6 (COG6, Accession XM_053233), a gene which is critical for the structure and function of the Golgi apparatus. Accordingly, utilities

of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COG6. The function of COG6 has been established by previous studies. Multiprotein complexes are key determinants of Golgi apparatus structure and its capacity for intracellular transport and glycoprotein modification. Several complexes have been identified, including the Golgi transport complex (GTC), the LDLC complex, which is involved in glycosylation reactions, and the SEC34 complex, which is involved in vesicular transport. These 3 complexes are identical and have been termed the conserved oligomeric Golgi (COG) complex, which includes COG6 (Ungar et al., 2002). By SDS-PAGE analysis of bovine brain cytosol, Ungar et al. (2002) identified the 8 subunits of the COG complex. Immunofluorescence microscopy demonstrated that COG1 (LDLB; 606973) colocalizes with COG7 (OMIM Ref. No. 606978), as well as with COG3 (OMIM Ref. No. 606975) and COG5 (OMIM Ref. No. 606821), with a Golgi marker in a perinuclear distribution. Immunoprecipitation analysis showed that all COG subunits interact with COG2 (LDLC; 606974). Ungar et al. (2002) concluded that the COG complex is critical for the structure and function of the Golgi apparatus and can influence intracellular mem-

brane trafficking.

- [5587] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [5588] Ungar, D.; Oka, T.; Brittle, E. E.; Vasile, E.; Lupashin, V. V.; Chatterton, J. E.; Heuser, J. E.; Krieger, M.; Waters, M. - [5590] Further studies establishing the function and utilities of COG6 are found in John Hopkins OMIM database record ID 606977, and in cited publications numbered 1684 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dachshund Homolog (*Drosophila*) (DACH, Accession NM_080759) is another VGAM187 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:2387, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5591] Another function of VGAM187 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM170.FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801) is another VGAM187 host target gene. FKBP1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP1A BINDING SITE, designated SEQ

ID:775, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5592] Another function of VGAM187 is therefore inhibition of FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801), a gene which FK506-binding protein 1A. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP1A. The function of FKBP1A has been established by previous studies. FK506, a macrolide, is a powerful immunosuppressant like cyclosporin A (CsA). CsA and FK506 are chemically distinct but have remarkably similar immunosuppressive action, although FK506 is many times more potent than CsA. The action of CsA may be mediated through cyclophilin (OMIM Ref. No. 123840), which is identical to peptidyl-prolyl cis-trans isomerase (OMIM Ref. No. PPlase), and the immunosuppressive action of CsA in T cells may be mediated through inhibition of this enzyme activity. FK506-binding protein (FKBP) also has peptidyl-prolyl cis-trans isomerase enzymatic activity; however, whereas cyclophilin binds to, and is inhibited by, CsA but does not recognize FK506, the converse holds for FKBP. Since the 2 drugs have essentially equivalent action

on T lymphocytes, it may be that they act through distinct pathways but their mode of action converges on PPlase activities. Maki et al. (1990) isolated and sequenced DNA coding for FKBP from human peripheral blood T lymphocytes by using mixed 20-mer oligonucleotide probes synthesized on the basis of the sequence of bovine FKBP. They found an open reading frame encoding 108 amino acid residues, the first 40 of which were identical to those of the bovine sequence. Analysis showed no significant sequence similarity to any other known protein, including cyclophilin. Southern blot analysis of human genomic DNA digested with different restriction enzymes suggested the existence of only a few copies of the FKBP gene. This is in contrast to the results indicating as many as 20 copies of the cyclophilin gene as well as possible pseudogenes in the mammalian genome. Standaert et al. (1990) likewise isolated a cDNA for FKBP and reported the derived amino acid sequence. The human FKBP cDNA sequence showed significant similarity to an open reading frame in the genome of *Neisseria meningitidis*. Wang et al. (1994) reported that in a yeast genetic screen, FKBP1 interacted with various type I receptors, including the TGF-beta type I receptor (OMIM Ref. No. 190181). Deletion, point muta-

tion, and co-immunoprecipitation studies demonstrated the specificity of this interaction, and competitive binding assays indicated that the type I receptor may be a natural ligand for FKBP1. Wang et al. (1994) concluded that FKBP1 may play a role in type I receptor-mediated signaling. Peattie et al. (1994) identified 3 distinct mRNAs for FKBP12, designated A, B, and C, that result from differential splicing or polyadenylation. All 3 encode the same protein sequence. The ryanodine receptor on the sarcoplasmic reticulum is the major source of calcium required for cardiac muscle excitation-contraction coupling. The channel is a tetramer comprised of 4 RYR2 (OMIM Ref. No. 180902) polypeptides and 4 FK506-binding proteins (OMIM Ref. No. FKBP1A). Marx et al. (2000) showed that protein kinase A (PKA; OMIM Ref. No. 176911) phosphorylation of RYR2 dissociates FKBP1A and regulates the channel open probability. Using cosedimentation and coimmunoprecipitation, the authors defined a macromolecular complex comprised of RYR2, FKBP1A, PKA, the protein phosphatases PP1 (see OMIM Ref. No. 603771) and PP2A (see OMIM Ref. No. 603113), and an anchoring protein, AKAP6 (OMIM Ref. No. 604691). In failing human hearts, Marx et al. (2000) showed that RYR2 is PKA hyper-

phosphorylated, resulting in defective channel function due to increased sensitivity to calcium-induced activation. To define the functions of FKBP12 in vivo, Shou et al. (1998) generated mutant mice deficient in FKBP12 using embryonic stem (ES) cell technology. FKBP12-deficient mice had normal skeletal muscle but had severe dilated cardiomyopathy and ventricular septal defects that mimicked a human congenital heart disorder, namely non-compaction of left ventricular myocardium (see OMIM Ref. No. 300183 for an X-linked form of myocardial noncompaction). About 9% of the mutants exhibited exencephaly secondary to a defect in neural tube closure. Physiologic studies demonstrated that FKBP12 is dispensable for TGF-beta-mediated signaling, but modulates the calcium release activity of both skeletal and cardiac ryanodine receptors.

[5593] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5594] Standaert, R. F.; Galat, A.; Verdine, G. L.; Schreiber, S. L. : Molecular cloning and overexpression of the human FK506-binding protein FKBP. *Nature* 346: 671-674, 1990. ; and

[5595] Shou, W.; Aghdasi, B.; Armstrong, D. L.; Guo, Q.; Bao, S.; Charng, M.-J.; Mathews, L. M.; Schneider, M. D.; Hamilton, S. L.; Matzuk, M. M. : Cardiac defects and altered ryanodine recepto.

[5596] Further studies establishing the function and utilities of FKBP1A are found in John Hopkins OMIM database record ID 186945, and in cited publications numbered 2271-227 and 2361-2279 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182) is another VGAM187 host target gene. HSPD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPD1 BINDING SITE, designated SEQ ID:2559, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5597] Another function of VGAM187 is therefore inhibition of Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182), a gene which is implicated in mito-

chondrial protein import and macromolecular assembly. may facilitate the correct folding of imported proteins. may also prevent misfolding and promote the refolding and proper assembly of unfolded polypeptides generated under stress conditions in the mitochondrial matrix. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPD1. The function of HSPD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM130. JJAZ1 (Accession NM_015355) is another VGAM187 host target gene. JJAZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JJAZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JJAZ1 BINDING SITE, designated SEQ ID:1622, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5598] Another function of VGAM187 is therefore inhibition of JJAZ1 (Accession NM_015355), a gene which is a zinc finger protein. Accordingly, utilities of VGAM187 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with JJAZ1. The function of JJAZ1 has been established by previous studies. Nagase et al. (1995) deduced the sequence of a full-length cDNA clone from cell line KG-1, which they designated KIAA0160, encoding a predicted 803-amino acid protein. Northern blot analysis revealed expression in all tissues tested. A variety of cytogenetic abnormalities involving chromosome 7 have been reported in endometrial stromal sarcomas, including a recurrent t(7;17)(p15;q21). Koontz et al. (2001) identified 2 zinc finger genes, which they termed JAZF1 (OMIM Ref. No. 606246) and JJAZ1, at the sites of the 7p15 and 17q21 breakpoints, respectively. Analyses of tumor RNA indicated that a JAZF1/JJAZ1 fusion was present in all types of endometrial stromal tumors; however, the fusion appeared to be rarer among endometrial stromal sarcomas that would be considered high-grade according to certain classification schemes

[5599] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5600] Koontz, J. I.; Soreng, A. L.; Nucci, M.; Kuo, F. C.; Pauwels, P.; van den Berghe, H.; Cin, P. D.; Fletcher, J. A.; Sklar, J. :

Frequent fusion of the JAZF1 and JJAZ1 genes in endometrial stromal tumors. Proc. Nat. Acad. Sci. 98: 6348–6353, 2001. ; and

[5601] Nagase, T.; Seki, N.; Tanaka, A.; Ishikawa, K.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. IV. The coding sequences of 40 new genes (KIAA0121–KIAA0160).

[5602] Further studies establishing the function and utilities of JJAZ1 are found in John Hopkins OMIM database record ID 606245, and in cited publications numbered 141 and 2524 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM_166312) is another VGAM187 host target gene. MAN1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1A1 BINDING SITE, designated SEQ ID:3543, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5603] Another function of VGAM187 is therefore inhibition of Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM_166312), a gene which removes 3 distinct mannose residues from peptide-bound Man(9)–GlcNAc(2) oligosaccharides. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1A1. The function of MAN1A1 has been established by previous studies. Man(9)–mannosidase (alpha–1,2–mannosidase 1A) catalyzes the removal of 3 distinct mannose residues from peptide-bound Man(9)–GlcNAc(2) oligosaccharides. See MAN2A1 (OMIM Ref. No. 154582) for general information. Using an oligonucleotide probe derived from a pig liver Man(9)–mannosidase–specific cDNA template, Bause et al. (1993) isolated Man(9)–mannosidase from a human kidney cDNA library. The full-length cDNA predicted a 625–amino acid protein with a calculated molecular mass of 71 kD. Man(9)–mannosidase is a type II transmembrane protein with a short cytoplasmic polypeptide tail, a single transmembrane domain acting as a noncleavable signal sequence, a large luminal catalytic domain, and 3 potential N–glycosylation sites

[5604] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [5605] Bause, E.; Bieberich, E.; Rolfs, A.; Volker, C.; Schmidt, B. : Molecular cloning and primary structure of Man(9)–mannosidase from human kidney. Eur. J. Biochem. 217: 535–540, 1993. ; and
- [5606] Tremblay, L. O; Campbell Dyke, N.; Herscovics, A. : Molecular cloning, chromosomal mapping and tissue–specific expression of a novel human alpha–1,2–mannosidase gene involved in N–glycan.
- [5607] Further studies establishing the function and utilities of MAN1A1 are found in John Hopkins OMIM database record ID 604344, and in cited publications numbered 1129–1130 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase (cAMP–dependent, catalytic) Inhibitor Beta (PKIB, Accession NM_032471) is another VGAM187 host target gene. PKIB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PKIB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIB BINDING SITE, designated SEQ ID:2254, to

the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5608] Another function of VGAM187 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Beta (PKIB, Accession NM_032471). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIB. Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096) is another VGAM187 host target gene. RRM2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2B BINDING SITE, designated SEQ ID:2799, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5609] Another function of VGAM187 is therefore inhibition of Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2B. SWAP70

(Accession XM_049197) is another VGAM187 host target gene. SWAP70 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:2917, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5610] Another function of VGAM187 is therefore inhibition of SWAP70 (Accession XM_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell activation. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75. Abhydrolase Domain Containing 3 (ABHD3, Accession NM_138340) is another VGAM187 host target gene. ABHD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ABHD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABHD3 BINDING SITE, designated SEQ ID:2436, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5611] Another function of VGAM187 is therefore inhibition of Abhydrolase Domain Containing 3 (ABHD3, Accession NM_138340). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABHD3. ATIP1 (Accession NM_020749) is another VGAM187 host target gene. ATIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATIP1 BINDING SITE, designated SEQ ID:1924, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5612] Another function of VGAM187 is therefore inhibition of ATIP1 (Accession NM_020749). Accordingly, utilities of

VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATIP1.

DKFZP564F013 (Accession XM_168479) is another VGAM187 host target gene. DKFZP564F013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564F013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F013 BINDING SITE, designated SEQ ID:3640, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5613] Another function of VGAM187 is therefore inhibition of DKFZP564F013 (Accession XM_168479). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F013. FN5 (Accession NM_020179) is another VGAM187 host target gene. FN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FN5 BINDING SITE, design-

nated SEQ ID:1898, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5614] Another function of VGAM187 is therefore inhibition of FN5 (Accession NM_020179). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FN5. KIAA0416 (Accession NM_015564) is another VGAM187 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:1637, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5615] Another function of VGAM187 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. KIAA0455 (Accession XM_051785) is another VGAM187 host target gene. KIAA0455 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0455 BINDING SITE, designated SEQ ID:2948, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5616] Another function of VGAM187 is therefore inhibition of KIAA0455 (Accession XM_051785). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0455. KIAA0912 (Accession XM_034904) is another VGAM187 host target gene. KIAA0912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0912 BINDING SITE, designated SEQ ID:2689, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5617] Another function of VGAM187 is therefore inhibition of

KIAA0912 (Accession XM_034904). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0912. KIAA0981 (Accession XM_028867) is another VGAM187 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:2597, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5618] Another function of VGAM187 is therefore inhibition of KIAA0981 (Accession XM_028867). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. KIAA1911 (Accession XM_056302) is another VGAM187 host target gene. KIAA1911 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1911 BINDING SITE, designated SEQ ID:2976, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5619] Another function of VGAM187 is therefore inhibition of KIAA1911 (Accession XM_056302). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1911. Keratin, Hair, Basic, 2 (KRTHB2, Accession NM_033033) is another VGAM187 host target gene. KRTHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KRTHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRTHB2 BINDING SITE, designated SEQ ID:2310, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5620] Another function of VGAM187 is therefore inhibition of Keratin, Hair, Basic, 2 (KRTHB2, Accession NM_033033). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with KRTHB2. Ribosomal Protein S6 Kinase, 52kDa, Polypeptide 1 (RPS6KC1, Accession NM_012424) is another VGAM187 host target gene. RPS6KC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KC1 BINDING SITE, designated SEQ ID:1429, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5621] Another function of VGAM187 is therefore inhibition of Ribosomal Protein S6 Kinase, 52kDa, Polypeptide 1 (RPS6KC1, Accession NM_012424). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KC1. Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820) is another VGAM187 host target gene. TOMM70A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOMM70A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:1558, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:522.

[5622] Another function of VGAM187 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM70A. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 188 (VGAM188) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5623] VGAM188 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM188 was detected is described hereinabove with reference to Figs. 1-8.

[5624] VGAM188 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM188 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[5625] VGAM188 gene encodes a VGAM188 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM188 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM188 precursor RNA is designated SEQ ID:174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:174 is located at position 97335 relative to the genome of Vaccinia Virus.

[5626] VGAM188 precursor RNA folds onto itself, forming VGAM188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5627] An enzyme complex designated DICER COMPLEX, `dices` the VGAM188 folded precursor RNA into VGAM188 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM188 RNA is designated SEQ ID:523, and is provided hereinbelow with reference to the sequence listing part.

[5628] VGAM188 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM188 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM188 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5629] VGAM188 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM188 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM188 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM188 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM188 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5630] The complementary binding of VGAM188 RNA, herein designated VGAM RNA, to host target binding sites on VGAM188 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM188 host target RNA into VGAM188 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[5631] It is appreciated that VGAM188 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM188 host target genes. The mRNA of each one of this plurality of VGAM188 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM188 RNA, herein designated VGAM RNA, and which when bound by VGAM188 RNA causes inhibition of translation of respective one or more VGAM188 host target proteins.

[5632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM188 gene, herein designated VGAM GENE, on one or more VGAM188 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5633] It is yet further appreciated that a function of VGAM188 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM188 correlate with, and may be deduced from, the identity of the host target genes which VGAM188 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5634] Nucleotide sequences of the VGAM188 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM188 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM188 are further described hereinbelow with reference to Table 1.

[5635] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM188 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM188 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5636] As mentioned hereinabove with reference to Fig. 1, a function of VGAM188 gene, herein designated VGAM is inhibition of expression of VGAM188 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM188 correlate with, and may be deduced from, the identity of the target genes which VGAM188 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5637] CDC23 (cell division cycle 23, yeast, homolog) (CDC23, Accession NM_004661) is a VGAM188 host target gene. CDC23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC23 BINDING SITE, designated SEQ ID:1141, to the nucleotide sequence of VGAM188 RNA,

herein designated VGAM RNA, also designated SEQ ID:523.

[5638] A function of VGAM188 is therefore inhibition of CDC23 (cell division cycle 23, yeast, homolog) (CDC23, Accession NM_004661), a gene which is the cell cycle-regulated component of the mitotic cyclin degradation system. Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC23. The function of CDC23 has been established by previous studies. is the cell cycle-regulated component of the mitotic cyclin degradation system.

[5639] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5640] Yu, H.; Peters, J.-M.; King, R. W.; Page, A. M.; Hieter, P.; Kirschner, M. W. : Identification of a cullin homology region in a subunit of the anaphase-promoting complex. Science 279: 1219-1222, 1998. ; and

[5641] Zhao, N.; Lai, F.; Fernald, A. A.; Eisenbart, J. D.; Espinosa, R., III.; Wang, P. W.; Le Beau, M. M. : Human CDC23: cDNA cloning, mapping to 5q31, genomic structure, and evaluation as a.

[5642] Further studies establishing the function and utilities of

CDC23 are found in John Hopkins OMIM database record ID 603462, and in cited publications numbered 661–662 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 3 (*C. elegans*) (EGLN3, Accession NM_033344) is another VGAM188 host target gene. EGLN3 BINDING SITE1 and EGLN3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EGLN3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN3 BINDING SITE1 and EGLN3 BINDING SITE2, designated SEQ ID:2330 and SEQ ID:1976 respectively, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5643] Another function of VGAM188 is therefore inhibition of Egl Nine Homolog 3 (*C. elegans*) (EGLN3, Accession NM_033344), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN3. The function of EGLN3 has been established by previous studies. In cul-

tured mammalian cells, Bruick and McKnight (2001) found that the inappropriate accumulation of HIF caused by forced expression of the HIF1- α subunit under normoxic conditions was attenuated by coexpression of HPH. Suppression of HPH in cultured *Drosophila melanogaster* cells by RNA interference resulted in elevated expression of the hypoxia-inducible gene LDH (see OMIM Ref. No. 150000) under normoxic conditions. Bruick and McKnight (2001) concluded that HPH is an essential component of the pathway through which cells sense oxygen. HIF is a transcriptional complex that plays a central role in mammalian oxygen homeostasis. Posttranslational modification by prolyl hydroxylation is a key regulatory event that targets HIF- α (HIF1; 603348) subunits for proteasomal destruction via the von Hippel-Lindau (VHL; 193300) ubiquitylation complex. Epstein et al. (2001) defined a conserved HIF-VHL-prolyl hydroxylase pathway in *C. elegans* and identified Egl9 as a dioxygenase that regulates HIF by prolyl hydroxylation. In mammalian cells, they showed that the HIF-prolyl hydroxylases are represented by 3 proteins with a conserved 2-histidine-1-carboxylate iron coordination motif at the catalytic site. The genes encoding these proteins were cloned and termed PHD1

(OMIM Ref. No. 606424), PHD2 (OMIM Ref. No. 606425), and PHD3 by the authors. Direct modulation of recombinant enzyme activity by graded hypoxia, iron chelation, and cobaltous ions mirrored the characteristics of HIF induction in vivo, fulfilling requirements for these enzymes being oxygen sensors that regulate HIF.

[5644] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5645] Bruick, R. K.; McKnight, S. L. : A conserved family of prolyl-4-hydroxylases that modify HIF. Science 294: 1337-1340, 2001. ; and

[5646] Epstein, A. C. R.; Gleadle, J. M.; McNeill, L. A.; Hewitson, K. S.; O'Rourke, J.; Mole, D. R.; Mukherji, M.; Metzen, E.; Wilson, M. I.; Dhanda, A.; Tian, Y.-M.; Masson, N.; Hamilton, D.

[5647] Further studies establishing the function and utilities of EGLN3 are found in John Hopkins OMIM database record ID 606426, and in cited publications numbered 1016-1017 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ring Finger Protein 7 (RNF7, Accession NM_014245) is another VGAM188 host target gene. RNF7 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF7 BINDING SITE, designated SEQ ID:1485, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5648] Another function of VGAM188 is therefore inhibition of Ring Finger Protein 7 (RNF7, Accession NM_014245). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF7. Williams-Beuren Syndrome Chromosome Region 5 (WBSCR5, Accession NM_022040) is another VGAM188 host target gene. WBSCR5 BINDING SITE1 through WBSCR5 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WBSCR5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR5 BINDING SITE1 through WBSCR5 BINDING SITE3, designated SEQ ID:1973, SEQ ID:2250 and SEQ ID:1479 respectively, to the nucleotide sequence of

VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5649] Another function of VGAM188 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 5 (WBSCR5, Accession NM_022040). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR5. CDT6 (Accession NM_021146) is another VGAM188 host target gene. CDT6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT6 BINDING SITE, designated SEQ ID:1945, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5650] Another function of VGAM188 is therefore inhibition of CDT6 (Accession NM_021146). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT6. DKFZp566D234 (Accession XM_030162) is another VGAM188 host target gene. DKFZp566D234 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D234 BINDING SITE, designated SEQ ID:2613, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5651] Another function of VGAM188 is therefore inhibition of DKFZp566D234 (Accession XM_030162). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D234. FLJ10525 (Accession NM_018126) is another VGAM188 host target gene. FLJ10525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10525 BINDING SITE, designated SEQ ID:1786, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5652] Another function of VGAM188 is therefore inhibition of

FLJ10525 (Accession NM_018126). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10525. FLJ12078 (Accession NM_024977) is another VGAM188 host target gene. FLJ12078 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12078 BINDING SITE, designated SEQ ID:2121, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5653] Another function of VGAM188 is therefore inhibition of FLJ12078 (Accession NM_024977). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12078. KIAA0007 (Accession XM_087089) is another VGAM188 host target gene. KIAA0007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0007 BINDING SITE, designated SEQ ID:3154, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5654] Another function of VGAM188 is therefore inhibition of KIAA0007 (Accession XM_087089). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0007. KIAA1728 (Accession XM_043492) is another VGAM188 host target gene. KIAA1728 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1728 BINDING SITE, designated SEQ ID:2819, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5655] Another function of VGAM188 is therefore inhibition of KIAA1728 (Accession XM_043492). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1728. MGC4643 (Accession NM_032715) is another

VGAM188 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:2272, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5656] Another function of VGAM188 is therefore inhibition of MGC4643 (Accession NM_032715). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. MPPE1 (Accession NM_023075) is another VGAM188 host target gene. MPPE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPPE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPPE1 BINDING SITE, designated SEQ ID:2029, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5657] Another function of VGAM188 is therefore inhibition of MPPE1 (Accession NM_023075). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPPE1. RNA Binding Protein S1, Serine-rich Domain (RNPS1, Accession NM_080594) is another VGAM188 host target gene. RNPS1 BINDING SITE1 and RNPS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RNPS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPS1 BINDING SITE1 and RNPS1 BINDING SITE2, designated SEQ ID:2376 and SEQ ID:1326 respectively, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5658] Another function of VGAM188 is therefore inhibition of RNA Binding Protein S1, Serine-rich Domain (RNPS1, Accession NM_080594). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPS1. LOC153027 (Accession XM_041221) is another VGAM188 host target gene. LOC153027 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by LOC153027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153027 BINDING SITE, designated SEQ ID:2792, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5659] Another function of VGAM188 is therefore inhibition of LOC153027 (Accession XM_041221). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153027. LOC153114 (Accession XM_098313) is another VGAM188 host target gene. LOC153114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153114 BINDING SITE, designated SEQ ID:3367, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:523.

[5660] Another function of VGAM188 is therefore inhibition of

LOC153114 (Accession XM_098313). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153114. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 189 (VGAM189) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5661] VGAM189 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM189 was detected is described hereinabove with reference to Figs. 1–8.

[5662] VGAM189 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5663] VGAM189 gene encodes a VGAM189 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM189 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM189 precursor RNA is designated SEQ ID:175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:175 is located at position 96362 relative to the genome of Vaccinia Virus.

[5664] VGAM189 precursor RNA folds onto itself, forming VGAM189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5665] An enzyme complex designated DICER COMPLEX, `dices` the VGAM189 folded precursor RNA into VGAM189 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide se-

quence of VGAM189 RNA is designated SEQ ID:524, and is provided hereinbelow with reference to the sequence listing part.

[5666] VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM189 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5667] VGAM189 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM189 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM189 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[5668] The complementary binding of VGAM189 RNA, herein designated VGAM RNA, to host target binding sites on VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM189 host target RNA into VGAM189 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5669] It is appreciated that VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM189 host target genes. The mRNA of each one of this plurality of VGAM189 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM189 RNA, herein designated VGAM RNA, and which when bound by VGAM189 RNA causes inhibition of translation of respective one or more VGAM189 host target proteins.

[5670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM189 gene, herein designated VGAM GENE, on one or more VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5671] It is yet further appreciated that a function of VGAM189 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM189 correlate with, and may be deduced from, the identity of the host target genes which VGAM189 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[5672] Nucleotide sequences of the VGAM189 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM189 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM189 are further described hereinbelow with reference to Table 1.

[5673] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM189 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM189 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5674] As mentioned hereinabove with reference to Fig. 1, a function of VGAM189 gene, herein designated VGAM is inhibition of expression of VGAM189 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM189 correlate with, and may be deduced from, the identity of the target genes which VGAM189 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5675] Sortilin 1 (SORT1, Accession NM_002959) is a VGAM189 host target gene. SORT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORT1 BINDING SITE, designated SEQ ID:974, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:524.

[5676] A function of VGAM189 is therefore inhibition of Sortilin 1 (SORT1, Accession NM_002959). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORT1. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577)

is another VGAM189 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:2618, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:524.

[5677] Another function of VGAM189 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. DKFZP434K1772 (Accession XM_041936) is another VGAM189 host target gene. DKFZP434K1772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434K1772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1772 BINDING SITE, designated SEQ ID:2797, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:524.

[5678] Another function of VGAM189 is therefore inhibition of DKFZP434K1772 (Accession XM_041936). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K1772. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872) is another VGAM189 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ ID:2392, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:524.

[5679] Another function of VGAM189 is therefore inhibition of Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to

here as Viral Genomic Address Messenger 190 (VGAM190) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5680] VGAM190 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM190 was detected is described hereinabove with reference to Figs. 1–8.

[5681] VGAM190 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5682] VGAM190 gene encodes a VGAM190 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM190 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM190 precursor RNA is designated SEQ ID:176, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:176 is located at position 100470 relative to the genome of Vaccinia Virus.

[5683] VGAM190 precursor RNA folds onto itself, forming VGAM190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5684] An enzyme complex designated DICER COMPLEX, `dices` the VGAM190 folded precursor RNA into VGAM190 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM190 RNA is designated SEQ ID:525, and is provided hereinbelow with reference to the sequence listing part.

[5685] VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM190 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM190 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5686] VGAM190 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM190 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM190 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM190 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM190 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5687] The complementary binding of VGAM190 RNA, herein designated VGAM RNA, to host target binding sites on VGAM190 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM190 host target RNA into VGAM190 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5688] It is appreciated that VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM190 host target genes. The mRNA of each one of this plurality of VGAM190 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM190 RNA, herein designated VGAM RNA, and which when bound by VGAM190 RNA causes inhibition of translation of respective one or more VGAM190 host target proteins.

[5689] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM190 gene, herein designated VGAM GENE, on one or more VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5690] It is yet further appreciated that a function of VGAM190 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM190 correlate with, and may be deduced from, the identity of the host

target genes which VGAM190 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5691] Nucleotide sequences of the VGAM190 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM190 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM190 are further described hereinbelow with reference to Table 1.

[5692] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM190 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM190 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5693] As mentioned hereinabove with reference to Fig. 1, a function of VGAM190 gene, herein designated VGAM is inhibition of expression of VGAM190 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM190 correlate with, and may be deduced from, the identity of the target genes which VGAM190

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5694] Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is a VGAM190 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:1176, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5695] A function of VGAM190 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155. Son of Sevenless Homolog 2 (Drosophila) (SOS2, Accession XM_043720) is another VGAM190 host target gene. SOS2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOS2 BINDING SITE, designated SEQ ID:2824, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5696] Another function of VGAM190 is therefore inhibition of Son of Sevenless Homolog 2 (Drosophila) (SOS2, Accession XM_043720). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOS2. BANP (Accession XM_038696) is another VGAM190 host target gene. BANP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BANP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANP BINDING SITE, designated SEQ ID:2744, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5697] Another function of VGAM190 is therefore inhibition of

BANP (Accession XM_038696). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANP. KIAA0446 (Accession XM_044155) is another VGAM190 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:2831, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5698] Another function of VGAM190 is therefore inhibition of KIAA0446 (Accession XM_044155). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. LOC115110 (Accession XM_049825) is another VGAM190 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:2924, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5699] Another function of VGAM190 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC148443 (Accession XM_086196) is another VGAM190 host target gene. LOC148443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148443 BINDING SITE, designated SEQ ID:3118, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5700] Another function of VGAM190 is therefore inhibition of LOC148443 (Accession XM_086196). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148443. LOC151826 (Accession XM_087312) is an-

other VGAM190 host target gene. LOC151826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151826 BINDING SITE, designated SEQ ID:3161, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5701] Another function of VGAM190 is therefore inhibition of LOC151826 (Accession XM_087312). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151826. LOC200609 (Accession XM_117256) is another VGAM190 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:3479, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:525.

[5702] Another function of VGAM190 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 191 (VGAM191) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5703] VGAM191 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM191 was detected is described hereinabove with reference to Figs. 1–8.

[5704] VGAM191 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM191 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5705] VGAM191 gene encodes a VGAM191 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM191

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM191 precursor RNA is designated SEQ ID:177, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:177 is located at position 99909 relative to the genome of Vaccinia Virus.

[5706] VGAM191 precursor RNA folds onto itself, forming VGAM191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5707] An enzyme complex designated DICER COMPLEX, `dices` the VGAM191 folded precursor RNA into VGAM191 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 90%) nucleotide sequence of VGAM191 RNA is designated SEQ ID:526, and is provided hereinbelow with reference to the sequence listing part.

[5708] VGAM191 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM191 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5709] VGAM191 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM191 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM191 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5710] The complementary binding of VGAM191 RNA, herein designated VGAM RNA, to host target binding sites on VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM191 host target RNA into VGAM191 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5711] It is appreciated that VGAM191 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM191 host target genes. The mRNA of each one of this plurality of VGAM191 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM191 RNA, herein designated VGAM RNA, and which when bound by VGAM191 RNA causes inhibition of translation of respective one or more VGAM191 host target proteins.

[5712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM191 gene, herein designated VGAM GENE, on one or more VGAM191 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5713] It is yet further appreciated that a function of VGAM191 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM191 correlate with, and may be deduced from, the identity of the host target genes which VGAM191 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5714] Nucleotide sequences of the VGAM191 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM191 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM191 are further described hereinbelow with reference to Table 1.

[5715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM191 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM191 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[5716] As mentioned hereinabove with reference to Fig. 1, a function of VGAM191 gene, herein designated VGAM is inhibition of expression of VGAM191 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM191 correlate with, and may be deduced from, the identity of the target genes which VGAM191 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5717] Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762) is a VGAM191 host target gene. BHLHB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHLHB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB3 BINDING SITE, designated SEQ ID:2163, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5718] A function of VGAM191 is therefore inhibition of Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762), a gene which represses both

basal and activated transcription. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB3. The function of BHLHB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127. IL2-inducible T-cell Kinase (ITK, Accession NM_005546) is another VGAM191 host target gene. ITK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:1223, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5719] Another function of VGAM191 is therefore inhibition of IL2-inducible T-cell Kinase (ITK, Accession NM_005546), a gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITK. The function of ITK has been established by previous studies. Signal transduction

through the T-cell receptor (TCR; OMIM Ref. No. 186880) and cytokine receptors on the surface of T lymphocytes occurs largely via tyrosine phosphorylation of intracellular substrates. Signal transduction is thought to occur via association of these receptors with intracellular protein tyrosine kinases. To identify unique T-cell tyrosine kinases, Gibson et al. (1993) used PCR-based cloning with degenerate oligonucleotides directed at highly conserved motifs of tyrosine kinase domains. In this way, they cloned the complete cDNA for a unique human tyrosine kinase that is expressed mainly in T lymphocytes and natural killer (NK) cells. The cDNA predicted an open reading frame of 1,866 bp encoding a protein with a predicted size of 72 kD, which was in keeping with its size on Western blotting. A single 6.2-kb mRNA and 72-kD protein were detected in T lymphocytes and NK-like cell lines, but were not detected in other cell lineages. Sequence comparisons suggested that the protein is probably the human homolog of a murine interleukin-2-inducible T-cell kinase (ITK). However, unlike ITK, the message and protein levels for the new entity did not vary markedly on stimulation of human IL-2 responsive T cells with IL-2. They referred to the gene and its protein product as EMT ('expressed mainly in

T cells'). They concluded that EMT is a member of a new family of intracellular kinases that includes BPK (the kinase mutant in X-linked agammaglobulinemia, 300300). The expression of EMT message and protein in thymocytes and mature T cells, combined with its homology to BPK and its chromosomal localization, suggested that EMT may play a role in thymic ontogeny and growth regulation of mature T cells. Integrin adhesion receptors mediate critical interactions of T cells with other cells and extracellular matrix components during trafficking, as well as during antigen-specific recognition events in tissue. Phosphatidylinositol 3-kinase (PI3K; OMIM Ref. No. 601232) has a role in the regulation of integrin activity by CD3 (see OMIM Ref. No. 186790)-TCR and in the regulation of ITK. Woods et al. (2001) determined that TCR-mediated activation of beta-1 integrins (see OMIM Ref. No. ITGB1; 135630) requires activation of ITK and PI3K-dependent recruitment of ITK to detergent-insoluble glycosphingolipid-enriched microdomains (DIGs) via binding of the pleckstrin homology domain of ITK to the PI3K product PI(3,4,5)-P3. Likewise, activation of PI3K and LCK (OMIM Ref. No. 153390) via CD4 (OMIM Ref. No. 186940) coreceptor stimulation can initiate beta-1 inte-

grin activation dependent on ITK function. CD4 stimulation, together with targeting of ITK to DIGs, also activates TCR-independent beta-1 integrin function. Changes in beta-1 integrin function mediated by TCR-induced activation of ITK are accompanied by ITK-dependent modulation of the actin cytoskeleton. Woods et al. (2001) concluded that TCR-mediated activation of beta-1 integrin involves membrane relocalization and activation of ITK via coordinate action of PI3K and an SRC family tyrosine kinase. Animal model experiments lend further support to the function of ITK. By homologous recombination, Schaeffer et al. (1999) disrupted the Rlk (TXK; 600058) gene in mice. Heterozygotes were completely normal. Homozygous null Rlk mice showed increased amounts of Itk mRNA. The authors hypothesized that upregulation of related Tec kinases may partially compensate for the lack of Rlk. Schaeffer et al. (1999) therefore generated Rlk $-/-$ Itk $-/-$ mice by interbreeding. Itk-deficient mice have reduced numbers of mature T cells, particularly CD4⁺ cells, causing a decreased CD4-to-CD8 ratio. Rlk $-/-$ Itk $-/-$ mutants, however, had normal T cell numbers. Both CD4⁺ and CD8⁺ cell numbers are increased relative to Itk $-/-$ mice. The persistent abnormal ratio of CD4⁺ to CD8⁺

cells suggested an altered regulation of lymphoid development and homeostasis in the double mutants. The double mutants had marked defects in T-cell receptor responses including proliferation, cytokine production, and apoptosis in vitro and adaptive immune responses to *Toxoplasma gondii* in vivo. Molecular events immediately downstream from the T-cell receptor were intact in *Rlk -/- Itk -/-* cells, but intermediate events including inositol trisphosphate production, calcium mobilization, and mitogen-activated protein kinase activation were impaired, establishing Tec kinases as critical regulators of T-cell receptor signaling required for phospholipase C-gamma activation.

[5720] It is appreciated that the abovementioned animal model for ITK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[5721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5722] Schaeffer, E. M.; Debnath, J.; Yap, G.; McVicar, D.; Liao, X. C.; Littman, D. R.; Sher, A.; Varmus, H. E.; Lenardo, M. J.; Schwartzberg, P. L. : Requirement for Tec kinases *Rlk* and

Itk in T cell receptor signaling and immunity. Science 284: 638–641, 1999. ; and

[5723] Woods, M. L.; Kivens, W. J.; Adelsman, M. A.; Qiu, Y.; August, A.; Shimizu, Y. : A novel function for the Tec family tyrosine kinase Itk in activation of beta-1 integrins by the T-cell.

[5724] Further studies establishing the function and utilities of ITK are found in John Hopkins OMIM database record ID 186973, and in cited publications numbered 266–270 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MpV17 Transgene, Murine Homolog, Glomerulosclerosis (MPV17, Accession XM_047175) is another VGAM191 host target gene. MPV17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPV17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPV17 BINDING SITE, designated SEQ ID:2888, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5725] Another function of VGAM191 is therefore inhibition of

MpV17 Transgene, Murine Homolog, Glomerulosclerosis (MPV17, Accession XM_047175), a gene which seems implicated in the metabolism of reactive oxygen species (by similarity). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPV17. The function of MPV17 has been established by previous studies. The Mpv17 strain of mice carries a transgenically produced retroviral insert in its genome (Weiher et al., 1990). The integration prevents the expression of the MPV17 gene, leading to the development of glomerulosclerosis in mice homozygous for the integration. Physiologically and histologically, the phenotype of the kidney disease resembles human glomerulosclerosis. The mice demonstrate nephrotic syndrome at an early age. Karasawa et al. (1993) isolated cDNA clones representing a single RNA species for the human homolog of the Mpv17 gene. Sequence analysis demonstrated over 90% identity in the region coding for a protein of 176 amino acids and unknown function. Cloning of the genomic locus revealed a single-copy gene, which, by somatic cell hybrid analysis and in situ hybridization, was mapped to 2p23-p21. Southern analysis of rodent/mouse somatic cell hybrids demonstrated

that the gene is located on mouse chromosome 5, thus defining a new region of homology between human 2p and mouse 5. Karasawa et al. (1993) demonstrated that the MPV17 coding region is not mutated in patients suffering from the Finnish type of congenital nephrotic syndrome (OMIM Ref. No. 256300).

- [5726] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [5729] Further studies establishing the function and utilities of MPV17 are found in John Hopkins OMIM database record ID 137960, and in cited publications numbered 499 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Macrophage Scavenger

Receptor 1 (MSR1, Accession NM_002445) is another VGAM191 host target gene. MSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE, designated SEQ ID:930, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5730] Another function of VGAM191 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession NM_002445), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSR1. The function of MSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49.RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799) is another VGAM191 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:1061, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5731] Another function of VGAM191 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Sterol Carrier Protein 2 (SCP2, Accession NM_002979) is another VGAM191 host target gene. SCP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCP2 BINDING SITE, designated SEQ ID:976, to the nu-

cleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5732] Another function of VGAM191 is therefore inhibition of Sterol Carrier Protein 2 (SCP2, Accession NM_002979), a gene which may regulate steroidogenesis. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCP2. The function of SCP2 has been established by previous studies. During meiotic prophase, chromosomes are arranged along proteinaceous axes called axial elements. In rat, the major protein components of axial elements are proteins of 30, 33, and 190 kD. The 30- and 33-kD proteins are closely related and appear to be products of a single gene, Scp3 (synaptonemal complex protein-3; 604759). Offenberger et al. (1998) isolated rat testis cDNAs encoding the 190-kD protein, which they designated Scp2. Sequence analysis revealed that Scp2 is a basic protein, with a pI of 8. Scp2 contains 2 clusters of S/T-P motifs, which are common in DNA-binding proteins, and a C-terminal coiled-coil region. In Southwestern blot experiments, recombinant Scp2 bound DNA. Using immunocytochemistry, Offenberger et al. (1998) determined that Scp2 localizes specifically to the synaptonemal complex in

the nuclei of rat testis meiotic prophase nuclei. Northern blot analysis indicated that Scp2 is expressed exclusively in testis. The authors noted that Scp2 shows some similarity at the amino acid sequence and secondary structural level to the *S. cerevisiae* Red1 protein, which is involved in meiotic recombination and the assembly of axial elements of synaptonemal complexes. They speculated that Scp2 is a DNA-binding protein involved in the structural organization of meiotic prophase chromosomes. By screening a human testis library with a partial rat Scp2 cDNA, Schalk et al. (1999) isolated cDNAs encoding human SCP2. The predicted 1,530-amino acid human protein shares 63% amino acid identity with rat Scp2. Like rat Scp2, human SCP2 contains S/T-P motifs, 2 nuclear targeting signals, and a C-terminal coiled-coil region.

[5733] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5734] Offenberg, H. H.; Schalk, J. A. C.; Meuwissen, R. L. J.; van Aalderen, M.; Kester, H. A.; Dietrich, A. J. J.; Heyting, C. : SCP2: a major protein component of the axial elements of synaptonemal complexes of the rat. *Nucleic Acids Res.* 26: 2572–2579, 1998. ; and

[5735] Schalk, J. A. C.; Offenberg, H. H.; Peters, E.; Groot, N. P. B.; Hoovers, J. M. N.; Heyting, C. : Isolation and characterization of the human SCP2 cDNA and chromosomal localization of t.

[5736] Further studies establishing the function and utilities of SCP2 are found in John Hopkins OMIM database record ID 604105, and in cited publications numbered 1618–1619 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP564K0822 (Accession XM_168378) is another VGAM191 host target gene. DKFZP564K0822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564K0822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564K0822 BINDING SITE, designated SEQ ID:3630, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5737] Another function of VGAM191 is therefore inhibition of DKFZP564K0822 (Accession XM_168378). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP564K0822. KIAA0564 (Accession XM_038664) is another VGAM191 host target gene. KIAA0564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:2742, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5738] Another function of VGAM191 is therefore inhibition of KIAA0564 (Accession XM_038664). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0564. KIAA0769 (Accession NM_014824) is another VGAM191 host target gene. KIAA0769 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0769 BINDING SITE, designated SEQ ID:1560, to the nucleotide sequence of VGAM191 RNA, herein designated

VGAM RNA, also designated SEQ ID:526.

[5739] Another function of VGAM191 is therefore inhibition of KIAA0769 (Accession NM_014824). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0769. KIAA1163 (Accession XM_086231) is another VGAM191 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1163 BINDING SITE, designated SEQ ID:3122, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5740] Another function of VGAM191 is therefore inhibition of KIAA1163 (Accession XM_086231). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. KIAA1332 (Accession XM_048774) is another VGAM191 host target gene. KIAA1332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:2909, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5741] Another function of VGAM191 is therefore inhibition of KIAA1332 (Accession XM_048774). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM_004768) is another VGAM191 host target gene. SFRS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS11 BINDING SITE, designated SEQ ID:1155, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5742] Another function of VGAM191 is therefore inhibition of Splicing Factor, Arginine/serine-rich 11 (SFRS11, Acces-

sion NM_004768). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS11. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM191 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:1521, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5743] Another function of VGAM191 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC138639 (Accession XM_059988) is another VGAM191 host target gene. LOC138639 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC138639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138639 BINDING SITE, designated SEQ ID:3020, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5744] Another function of VGAM191 is therefore inhibition of LOC138639 (Accession XM_059988). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138639. LOC147299 (Accession XM_085763) is another VGAM191 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:3107, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5745] Another function of VGAM191 is therefore inhibition of LOC147299 (Accession XM_085763). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147299. LOC90019 (Accession NM_138567) is another VGAM191 host target gene. LOC90019 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90019 BINDING SITE, designated SEQ ID:2445, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:526.

[5746] Another function of VGAM191 is therefore inhibition of LOC90019 (Accession NM_138567). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90019. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 192 (VGAM192) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5747] VGAM192 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM192 was detected is described hereinabove with reference to Figs. 1–8.

[5748] VGAM192 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5749] VGAM192 gene encodes a VGAM192 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM192 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM192 precursor RNA is designated SEQ ID:178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:178 is located at position 102578 relative to the genome of Vaccinia Virus.

[5750] VGAM192 precursor RNA folds onto itself, forming VGAM192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5751] An enzyme complex designated DICER COMPLEX, `dices` the VGAM192 folded precursor RNA into VGAM192 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM192 RNA is designated SEQ ID:527, and is provided hereinbelow with reference to the sequence listing part.

[5752] VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM192 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM192 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5753] VGAM192 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM192 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM192 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM192 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM192 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[5754] The complementary binding of VGAM192 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM192 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM192 host target RNA into VGAM192 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5755] It is appreciated that VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM192 host target genes. The mRNA of each one of this plurality of VGAM192 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM192 RNA, herein designated VGAM RNA, and which when bound by VGAM192 RNA causes inhibition of translation of respective one or more VGAM192 host target proteins.

[5756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM192 gene, herein designated VGAM GENE, on one or more VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5757] It is yet further appreciated that a function of VGAM192 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM192 correlate with, and may be deduced from, the identity of the host target genes which VGAM192 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5758] Nucleotide sequences of the VGAM192 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM192 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM192 are further described hereinbelow with reference to Table 1.

[5759] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM192 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM192 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5760] As mentioned hereinabove with reference to Fig. 1, a function of VGAM192 gene, herein designated VGAM is inhibition of expression of VGAM192 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM192 correlate with, and may be deduced from, the identity of the target genes which VGAM192 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5761] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033173) is a VGAM192 host target gene. B3GALT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by B3GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT5 BINDING SITE, designated SEQ ID:2320, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5762] A function of VGAM192 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033173). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT5. Basic Transcription Element Binding Protein 1 (BTEB1, Accession NM_001206) is another VGAM192 host target gene. BTEB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTEB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTEB1 BINDING SITE, designated SEQ ID:808, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5763] Another function of VGAM192 is therefore inhibition of Basic Transcription Element Binding Protein 1 (BTEB1, Accession NM_001206). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTEB1. Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915) is another VGAM192 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:1340, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5764] Another function of VGAM192 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM_030809) is another VGAM192 host target gene. C12orf22 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by C12orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C12orf22 BINDING SITE, designated SEQ ID:2169, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5765] Another function of VGAM192 is therefore inhibition of Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM_030809). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf22. Chromosome 20 Open Reading Frame 26 (C20orf26, Accession XM_046598) is another VGAM192 host target gene. C20orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf26 BINDING SITE, designated SEQ ID:2879, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ

ID:527.

[5766] Another function of VGAM192 is therefore inhibition of Chromosome 20 Open Reading Frame 26 (C20orf26, Accession XM_046598). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf26.

FLJ14627 (Accession NM_032814) is another VGAM192 host target gene. FLJ14627 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14627 BINDING SITE, designated SEQ ID:2283, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5767] Another function of VGAM192 is therefore inhibition of FLJ14627 (Accession NM_032814). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14627. G Protein-coupled Receptor 72 (GPR72, Accession XM_045812) is another VGAM192 host target gene. GPR72 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by GPR72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR72 BINDING SITE, designated SEQ ID:2867, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5768] Another function of VGAM192 is therefore inhibition of G Protein-coupled Receptor 72 (GPR72, Accession XM_045812). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR72. Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443) is another VGAM192 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:2418, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5769] Another function of VGAM192 is therefore inhibition of

Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. KIAA0470 (Accession NM_014812) is another VGAM192 host target gene. KIAA0470 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0470 BINDING SITE, designated SEQ ID:1556, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5770] Another function of VGAM192 is therefore inhibition of KIAA0470 (Accession NM_014812). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0470. KIAA1328 (Accession XM_029429) is another VGAM192 host target gene. KIAA1328 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1328, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1328 BINDING SITE, designated SEQ ID:2602, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5771] Another function of VGAM192 is therefore inhibition of KIAA1328 (Accession XM_029429). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1328. KIAA1981 (Accession XM_114000) is another VGAM192 host target gene. KIAA1981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1981 BINDING SITE, designated SEQ ID:3430, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5772] Another function of VGAM192 is therefore inhibition of KIAA1981 (Accession XM_114000). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1981. MGC17330 (Accession NM_052880) is another VGAM192 host target gene. MGC17330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC17330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC17330 BINDING SITE, designated SEQ ID:2342, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5773] Another function of VGAM192 is therefore inhibition of MGC17330 (Accession NM_052880). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17330. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM192 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:1701, to the nucleotide sequence of

VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5774] Another function of VGAM192 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. LOC205011 (Accession XM_117741) is another VGAM192 host target gene. LOC205011 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC205011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205011 BINDING SITE, designated SEQ ID:3492, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:527.

[5775] Another function of VGAM192 is therefore inhibition of LOC205011 (Accession XM_117741). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205011. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 193 (VGAM193) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5776] VGAM193 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM193 was detected is described hereinabove with reference to Figs. 1–8.

[5777] VGAM193 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5778] VGAM193 gene encodes a VGAM193 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM193 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM193 precursor RNA is designated SEQ ID:179, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:179 is located at position 103285 relative to the genome of Vac–

cinia Virus.

[5779] VGAM193 precursor RNA folds onto itself, forming VGAM193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5780] An enzyme complex designated DICER COMPLEX, `dices` the VGAM193 folded precursor RNA into VGAM193 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM193 RNA is designated SEQ ID:528, and is provided hereinbelow with reference to the sequence listing part.

[5781] VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM193 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5782] VGAM193 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM193 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM193 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[5783] The complementary binding of VGAM193 RNA, herein designated VGAM RNA, to host target binding sites on VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM193 host target RNA into VGAM193 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5784] It is appreciated that VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM193 host target genes. The mRNA of each one of this plurality of VGAM193 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM193 RNA, herein designated VGAM RNA, and which when bound by VGAM193 RNA causes inhibition of translation of respective one or more VGAM193 host target proteins.

[5785] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM193 gene, herein designated VGAM GENE, on one or more VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5786] It is yet further appreciated that a function of VGAM193 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM193 correlate

with, and may be deduced from, the identity of the host target genes which VGAM193 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5787] Nucleotide sequences of the VGAM193 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM193 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM193 are further described hereinbelow with reference to Table 1.

[5788] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM193 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM193 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5789] As mentioned hereinabove with reference to Fig. 1, a function of VGAM193 gene, herein designated VGAM is inhibition of expression of VGAM193 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM193 correlate with, and may be deduced

from, the identity of the target genes which VGAM193 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5790] KIAA1228 (Accession XM_036408) is a VGAM193 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:2712, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:528.

[5791] A function of VGAM193 is therefore inhibition of KIAA1228 (Accession XM_036408). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. KIAA1655 (Accession XM_039442) is another VGAM193 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:2754, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:528.

[5792] Another function of VGAM193 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. N-deacetylase/N-sulfotransferase (heparan glucosaminyl) 3 (NDST3, Accession NM_004784) is another VGAM193 host target gene. NDST3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDST3 BINDING SITE, designated SEQ ID:1157, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:528.

[5793] Another function of VGAM193 is therefore inhibition of N-deacetylase/N-sulfotransferase (heparan glucosaminyl) 3 (NDST3, Accession NM_004784). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with NDST3. PP1057 (Accession NM_031285) is another VGAM193 host target gene. PP1057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1057 BINDING SITE, designated SEQ ID:2189, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:528.

[5794] Another function of VGAM193 is therefore inhibition of PP1057 (Accession NM_031285). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1057. RNP24 (Accession NM_006815) is another VGAM193 host target gene. RNP24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNP24 BINDING SITE, designated SEQ ID:1333, to the nucleotide sequence of VGAM193 RNA,

herein designated VGAM RNA, also designated SEQ ID:528.

[5795] Another function of VGAM193 is therefore inhibition of RNP24 (Accession NM_006815). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNP24. LOC150142 (Accession XM_086791) is another VGAM193 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:3142, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:528.

[5796] Another function of VGAM193 is therefore inhibition of LOC150142 (Accession XM_086791). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC199899 (Accession XM_117153) is another VGAM193 host target gene. LOC199899 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC199899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199899 BINDING SITE, designated SEQ ID:3473, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:528.

[5797] Another function of VGAM193 is therefore inhibition of LOC199899 (Accession XM_117153). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199899. LOC222068 (Accession XM_166556) is another VGAM193 host target gene. LOC222068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222068 BINDING SITE, designated SEQ ID:3573, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:528.

[5798] Another function of VGAM193 is therefore inhibition of LOC222068 (Accession XM_166556). Accordingly, utilities

of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222068. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 194 (VGAM194) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5799] VGAM194 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM194 was detected is described hereinabove with reference to Figs. 1–8.

[5800] VGAM194 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM194 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5801] VGAM194 gene encodes a VGAM194 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM194 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM194 precursor RNA is designated SEQ ID:180, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:180 is located at position 103379 relative to the genome of Vaccinia Virus.

[5802] VGAM194 precursor RNA folds onto itself, forming VGAM194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5803] An enzyme complex designated DICER COMPLEX, `dices` the VGAM194 folded precursor RNA into VGAM194 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM194 RNA is designated SEQ ID:529, and is

provided hereinbelow with reference to the sequence listing part.

[5804] VGAM194 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM194 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM194 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5805] VGAM194 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM194 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM194 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM194 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM194 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5806] The complementary binding of VGAM194 RNA, herein designated VGAM RNA, to host target binding sites on VGAM194 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM194 host target RNA into VGAM194 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5807] It is appreciated that VGAM194 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM194 host target genes. The mRNA of each one of this plurality of VGAM194 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM194 RNA, herein designated VGAM RNA, and which when bound by VGAM194 RNA causes inhibition of translation of respective one or more VGAM194 host target proteins.

[5808] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM194 gene, herein designated VGAM GENE, on one or more VGAM194 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5809] It is yet further appreciated that a function of VGAM194 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM194 correlate with, and may be deduced from, the identity of the host target genes which VGAM194 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5810] Nucleotide sequences of the VGAM194 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM194 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM194 are further described hereinbelow with reference to Table 1.

[5811] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM194 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM194 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5812] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM194 gene, herein designated VGAM is inhibition of expression of VGAM194 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM194 correlate with, and may be deduced from, the identity of the target genes which VGAM194 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5813] HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM_165873) is a VGAM194 host target gene. HUS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUS1 BINDING SITE, designated SEQ ID:3509, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:529.

[5814] A function of VGAM194 is therefore inhibition of HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM_165873), a gene which May form DNA damage-responsive protein complex . Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUS1. The

function of HUS1 has been established by previous studies. The *S. pombe* 'checkpoint rad' genes *hus1*, *rad1* (OMIM Ref. No. 603153), *rad3*, *rad9* (OMIM Ref. No. 603761), *rad17* (OMIM Ref. No. 603139), and *rad26* are essential for both the incomplete DNA replication (S-M) and DNA damage checkpoints. An early step in the DNA damage checkpoint response appears to involve activation of the *rad3* phosphatidylinositol 3-kinase-related (PIK-R) checkpoint kinase (see OMIM Ref. No. AT; 208900) by the other 5 checkpoint rad gene products. Kostrub et al. (1998) found that the fission yeast *hus1* and *rad1* proteins form a stable complex, and that the formation of this complex is dependent on *rad9*, suggesting that these 3 proteins may exist in a discrete complex in the absence of checkpoint activation. Hus1 is phosphorylated in response to DNA damage, and this phosphorylation requires *rad3* and the other checkpoint rad genes. By searching EST databases, Kostrub et al. (1998) and Dean et al. (1998) each identified mouse and human cDNAs encoding *hus1* homologs. Kostrub et al. (1998) reported that the predicted 281-amino acid human protein shares 30% and 86% identity with *S. pombe hus1* and mouse Hus1, respectively. However, neither mammalian gene comple-

mented a fission yeast *hus1* mutation. Volkmer and Karnitz (1999) demonstrated that the human RAD1 and HUS1 proteins associate in a complex that interacts with a highly modified form of RAD9. They concluded that these 3 proteins are central components of a DNA damage-responsive protein complex in human cells. AU-rich elements (AREs) are cis-acting sequences typically found in 3-prime untranslated regions of many labile mRNAs. AREs either mediate rapid degradation of mRNA or inhibit its translation. Dominguez et al. (1998) identified EE2-16C, a HUS1 cDNA, among a collection of ARE-containing mRNAs.

[5815] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5816] Kostrub, C. F.; Knudsen, K.; Subramani, S.; Enoch, T. : Hus1p, a conserved fission yeast checkpoint protein, interacts with Rad1p and is phosphorylated in response to DNA damage. EMBO J. 17: 2055-2066, 1998. ; and

[5817] Volkmer, E.; Karnitz, L. M. : Human homologs of *Schizosaccharomyces pombe* Rad1, Hus1, and Rad9 form a DNA damage-responsive protein complex. J. Biol. Chem. 274: 567-570, 1999.

[5818] Further studies establishing the function and utilities of HUS1 are found in John Hopkins OMIM database record ID 603760, and in cited publications numbered 145, 1744-174 and 580 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080) is another VGAM194 host target gene. TRPM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:2052, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:529.

[5819] Another function of VGAM194 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of

TRPM8 has been established by previous studies. Using expression cloning of a rat trigeminal nerve cDNA library in a human embryonic kidney cell line and screening for changes in intracellular calcium on exposure to room-temperature menthol, McKemy et al. (2002) identified a cDNA encoding Cmr1 (cold-menthol receptor-1). The deduced 1,104-amino acid protein, 92% identical to human TRPM8, is also responsive to icilin, cold (with a range from 8 to 28 degrees C), and eucalyptol (the main constituent of oil of Eucalyptus) with low or no responses to menthone, camphor, cyclohexanol, or capsaicin, the agonist for VR1, which is related to the TRP family. Northern blot analysis detected transcripts of 6.0 and 4.5 kb in rat dorsal root ganglia and trigeminal neurons. In situ hybridization analysis demonstrated expression in small-diameter, but not larger-diameter, sensory neurons, similar in size to VR1-expressing cells. Cells expressing both Cmr1 and Vr1 endow cells to respond to distinct temperature thresholds, cool and hot (more than 43 degrees C), respectively. McKemy et al. (2002) suggested this coexpression may explain the paradox that noxious cold is sometimes perceived as burning pain. The authors also proposed that in other contexts, such as prostate and tu-

mors, an endogenous menthol-like ligand may modulate the TRPM8 channel. Peier et al. (2002) showed that mouse Trpm8 is specifically expressed in a subset of pain- and temperature-sensing neurons. Cells overexpressing the Trpm8 channel could be activated by cold temperatures and by a cooling agent, menthol. The authors concluded that the identification of a cold-sensing TRP channel in a distinct subpopulation of sensory neurons implicated an expanded role for this family of ion channels in somatic sensory detection.

[5820] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5821] McKemy, D. D.; Neuhausser, W. M.; Julius, D. : Identification of a cold receptor reveals a general role for TRP channels in thermosensation. *Nature* 416: 52–58, 2002. ; and

[5822] Peier, A. M.; Moqrich, A.; Hergarden, A. C.; Reeve, A. J.; Andersson, D. A.; Story, G. M.; Earley, T. J.; Dragoni, I.; McIntyre, P.; Bevan, S.; Patapoutian, A. : A TRP channel that sense.

[5823] Further studies establishing the function and utilities of TRPM8 are found in John Hopkins OMIM database record ID 606678, and in cited publications numbered 1268–127

and 1113 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC148936 (Accession XM_097556) is another VGAM194 host target gene. LOC148936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148936 BINDING SITE, designated SEQ ID:3304, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:529.

[5824] Another function of VGAM194 is therefore inhibition of LOC148936 (Accession XM_097556). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148936. LOC148938 (Accession XM_097555) is another VGAM194 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148938 BINDING SITE, designated SEQ ID:3303, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:529.

[5825] Another function of VGAM194 is therefore inhibition of LOC148938 (Accession XM_097555). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148938. LOC200803 (Accession XM_114299) is another VGAM194 host target gene. LOC200803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200803 BINDING SITE, designated SEQ ID:3452, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:529.

[5826] Another function of VGAM194 is therefore inhibition of LOC200803 (Accession XM_114299). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200803. LOC255332 (Accession XM_171235) is another VGAM194 host target gene. LOC255332 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255332 BINDING SITE, designated SEQ ID:3696, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:529.

[5827] Another function of VGAM194 is therefore inhibition of LOC255332 (Accession XM_171235). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255332. LOC90459 (Accession XM_031826) is another VGAM194 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:2641, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:529.

[5828] Another function of VGAM194 is therefore inhibition of

LOC90459 (Accession XM_031826). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 195 (VGAM195) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5829] VGAM195 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM195 was detected is described hereinabove with reference to Figs. 1–8.

[5830] VGAM195 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM195 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5831] VGAM195 gene encodes a VGAM195 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM195 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM195 precursor RNA is designated SEQ ID:181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:181 is located at position 105936 relative to the genome of Vaccinia Virus.

[5832] VGAM195 precursor RNA folds onto itself, forming VGAM195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5833] An enzyme complex designated DICER COMPLEX, `dices` the VGAM195 folded precursor RNA into VGAM195 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide se-

quence of VGAM195 RNA is designated SEQ ID:530, and is provided hereinbelow with reference to the sequence listing part.

[5834] VGAM195 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM195 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5835] VGAM195 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM195 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM195 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[5836] The complementary binding of VGAM195 RNA, herein designated VGAM RNA, to host target binding sites on VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM195 host target RNA into VGAM195 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5837] It is appreciated that VGAM195 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM195 host target genes. The mRNA of each one of this plurality of VGAM195 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM195 RNA, herein designated VGAM RNA, and which when bound by VGAM195 RNA causes inhibition of translation of respective one or more VGAM195 host target proteins.

[5838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM195 gene, herein designated VGAM GENE, on one or more VGAM195 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5839] It is yet further appreciated that a function of VGAM195 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM195 correlate with, and may be deduced from, the identity of the host target genes which VGAM195 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5840] Nucleotide sequences of the VGAM195 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM195 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM195 are further described hereinbelow with reference to Table 1.

[5841] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM195 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM195 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5842] As mentioned hereinabove with reference to Fig. 1, a function of VGAM195 gene, herein designated VGAM is inhibition of expression of VGAM195 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM195 correlate with, and may be deduced from, the identity of the target genes which VGAM195 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5843] DKFZp434E0519 (Accession NM_032247) is a VGAM195 host target gene. DKFZp434E0519 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434E0519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E0519 BINDING SITE, designated SEQ ID:2241, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:530.

[5844] A function of VGAM195 is therefore inhibition of DKFZp434E0519 (Accession NM_032247). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E0519. HSU84971 (Accession NM_013303) is

another VGAM195 host target gene. HSU84971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSU84971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU84971 BINDING SITE, designated SEQ ID:1439, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:530.

[5845] Another function of VGAM195 is therefore inhibition of HSU84971 (Accession NM_013303). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU84971. LOC157663 (Accession XM_088354) is another VGAM195 host target gene. LOC157663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157663 BINDING SITE, designated SEQ ID:3203, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:530.

[5846] Another function of VGAM195 is therefore inhibition of LOC157663 (Accession XM_088354). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157663. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 196 (VGAM196) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5847] VGAM196 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM196 was detected is described hereinabove with reference to Figs. 1–8.

[5848] VGAM196 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5849] VGAM196 gene encodes a VGAM196 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM196

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM196 precursor RNA is designated SEQ ID:182, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:182 is located at position 103914 relative to the genome of Vaccinia Virus.

[5850] VGAM196 precursor RNA folds onto itself, forming VGAM196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5851] An enzyme complex designated DICER COMPLEX, `dices` the VGAM196 folded precursor RNA into VGAM196 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 84%) nucleotide sequence of VGAM196 RNA is designated SEQ ID:531, and is provided hereinbelow with reference to the sequence listing part.

[5852] VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM196 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5853] VGAM196 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM196 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM196 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5854] The complementary binding of VGAM196 RNA, herein designated VGAM RNA, to host target binding sites on VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM196 host target RNA into VGAM196 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5855] It is appreciated that VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM196 host target genes. The mRNA of each one of this plurality of VGAM196 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM196 RNA, herein designated VGAM RNA, and which when bound by VGAM196 RNA causes inhibition of translation of respective one or more VGAM196 host target proteins.

[5856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM196 gene, herein designated VGAM GENE, on one or more VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5857] It is yet further appreciated that a function of VGAM196 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM196 correlate with, and may be deduced from, the identity of the host target genes which VGAM196 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5858] Nucleotide sequences of the VGAM196 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM196 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM196 are further described hereinbelow with reference to Table 1.

[5859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM196 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM196 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[5860] As mentioned hereinabove with reference to Fig. 1, a function of VGAM196 gene, herein designated VGAM is inhibition of expression of VGAM196 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM196 correlate with, and may be deduced from, the identity of the target genes which VGAM196 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5861] Exostoses (multiple) 2 (EXT2, Accession NM_000401) is a VGAM196 host target gene. EXT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXT2 BINDING SITE, designated SEQ ID:737, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5862] A function of VGAM196 is therefore inhibition of Exostoses (multiple) 2 (EXT2, Accession NM_000401). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with EXT2. Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM196 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:1936, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5863] Another function of VGAM196 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL has been established by previous studies. By screening for cDNAs with the potential to encode large proteins expressed in brain, Ishikawa et al. (1997) identified a cDNA encoding MBNL, which they designated KIAA0428. KIAA0428 encodes a deduced 370-amino acid protein. RT-PCR analysis detected highest expression of KIAA0428 in skeletal muscle, followed by

prostate, lung, heart, small intestine, ovary, and placenta. Triplet repeat expansion disorders (e.g., myotonic dystrophy; 160900) are characterized by genetic anticipation in which disease severity is proportional and age-of-onset is inversely proportional to the size of the expansion mutation. By biochemical purification of HeLa cell proteins binding to dystrophin myotonia (DM1) protein kinase (DMPK; 605377) RNAs with variable numbers of CUG repeats, followed by peptide sequence analysis and PCR, Miller et al. (2000) isolated cDNAs encoding isoforms of MBNL, which they termed EXP. The 42- and 40-kD isoforms, EXP42 and EXP40, are identical to a previously identified 388-amino acid MBNL protein (GenBank CAA74155) and KIAA0428, respectively, while the 35-kD isoform, EXP35, is a novel 305-amino acid protein. Northern blot analysis revealed 6.5- and 5.3-kb EXP transcripts that were highly expressed in cardiac and skeletal muscle. Western blot analysis showed high expression of EXP42 in HeLa and lymphoblastoid cell lines. Immunofluorescence microscopy demonstrated nuclear and cytoplasmic expression of EXP42 in normal myoblasts, while nuclear foci were enriched in DM1 myoblasts. FISH and immunofluorescence analyses suggested that DMPK mutant RNAs re-

cruit and sequester EXP dsRNA-binding proteins. Miller et al. (2000) proposed that the DM1 mutation produces a competing dsRNA-binding substrate that recruits the EXP proteins and sequesters them away from their normal RNA-binding sites during cell differentiation. By radiation hybrid analysis, Ishikawa et al. (1997) mapped the MBNL gene to chromosome 3. Miller et al. (2000) mapped the MBNL gene to 3q25, distal to the DM2 (OMIM Ref. No. 602668) and PROMM (OMIM Ref. No. 600109) loci on 3q21.

- [5864] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [5865] Miller, J. W.; Urbinati, C. R.; Teng-umnuay, P.; Stenberg, M. G.; Byrne, B. J.; Thornton, C. A.; Swanson, M. S. : Re-cruitment of human muscleblind proteins to (CUG)_n expansions associated with myotonic dystrophy. EMBO J. 19: 4439–4448, 2000. ; and
- [5866] Ishikawa, K.; Nagase, T.; Nakajima, D.; Seki, N.; Ohira, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes.
- [5867] Further studies establishing the function and utilities of

MBNL are found in John Hopkins OMIM database record ID 606516, and in cited publications numbered 145 and 1973 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phospholamban (PLN, Accession NM_002667) is another VGAM196 host target gene. PLN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLN BINDING SITE, designated SEQ ID:946, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5868] Another function of VGAM196 is therefore inhibition of Phospholamban (PLN, Accession NM_002667), a gene which regulates the activity of the calcium pump of cardiac sarcoplasmic reticulum. Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLN. The function of PLN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM104. Solute Carrier Family 12

(sodium/potassium/chloride transporters), Member 2 (SLC12A2, Accession NM_001046) is another VGAM196 host target gene. SLC12A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC12A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A2 BINDING SITE, designated SEQ ID:796, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5869] Another function of VGAM196 is therefore inhibition of Solute Carrier Family 12 (sodium/potassium/chloride transporters), Member 2 (SLC12A2, Accession NM_001046), a gene which transports chloride ions across secretory epithelia. Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A2. The function of SLC12A2 has been established by previous studies. By moving chloride into epithelial cells, the Na-K-Cl cotransporter aids transcellular movement of chloride across both secretory and absorptive epithelia. Using cDNA probes from the elasmobranch secretory Na-K-Cl cotransporter

reported by Xu et al. (1994), Payne et al. (1995) identified the human homolog, which they referred to as NKCC1. By screening cDNA libraries of a human colonic carcinoma cell line, they identified a sequence of 4,115 bases that encoded a deduced protein of 1,212 amino acids with 12 transmembrane segments. By fluorescence in situ hybridization, they localized the cotransporter gene to 5q23.3. Human embryonic kidney cells stably transfected with the full-length cDNA expressed a protein of approximately 170 kD which was recognized by anti-cotransporter antibodies. Following treatment with N-glycosidase F, the molecular mass of the expressed protein was similar to that predicted for the core protein from the cDNA sequence. Evans et al. (2000) tested directly the possibility that the salivary fluid secretory mechanism requires $\text{Na}^+/\text{K}^+/\text{2Cl}^-$ cotransporter-mediated Cl^- uptake. They studied the in vivo and in vitro functioning of acinar cells from the parotid glands of mice with targeted disruption of the *Nkcc1* gene, which encodes the salivary cotransporter. In wildtype mice *Nkcc1* was localized to the basolateral membranes of parotid acinar cells, whereas expression was not detected in duct cells. The lack of functional *Nkcc1* resulted in a dramatic reduction (greater

than 60%) in the volume of saliva secreted in response to a muscarinic agonist, the primary in situ salivation signal. Expression of the chloride/bicarbonate exchanger AE2 (SLC4A2; 109280) was enhanced, suggesting that this transporter compensates for the loss of functional Nkcc1. The ability of the parotid gland to conserve NaCl was abolished in Nkcc1-deficient mice. Evans et al. (2000) suggested that some cases of 'idiopathic' dry mouth disease may have a basis in a defect of Nkcc1.

[5870] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5872] Evans, R. L.; Park, K.; Turner, R. J.; Watson, G. E.; Nguyen, H.-V.; Dennett, M. R.; Hand, A. R.; Flagella, M.; Shull, G. E.; Melvin, J. E. : Severe impairment of salivation in Na⁺/K⁺/2Cl.

[5873] Further studies establishing the function and utilities of SLC12A2 are found in John Hopkins OMIM database

record ID 600840, and in cited publications numbered 216 and 2162–2165 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3, Accession NM_004172) is another VGAM196 host target gene. SLC1A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A3 BINDING SITE, designated SEQ ID:1092, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5874] Another function of VGAM196 is therefore inhibition of Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3, Accession NM_004172), a gene which is a transporter molecule that regulates neurotransmitter concentrations at excitatory synapses of the mammalian CNS. Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A3. The function of SLC1A3 has been established by previous studies.

Kirschner et al. (1994) mapped the human EAAT1 gene to 5p13 by fluorescence in situ hybridization. They used interspecific backcross analysis to map the murine homolog to chromosome 15 in a region of homology to human 5p13. They commented that the EAAT1 locus may be related to the syndrome of microcephaly and mental retardation observed by Keppen et al. (1992) in association with interstitial deletion of distal band 5p13. In the retina, the glutamate transporter GLAST is expressed in Muller cells, whereas the glutamate transporter GLT1 is found only in cones and various types of bipolar cells. To investigate the functional role of this differential distribution of glutamate transporters, Harada et al. (1998) analyzed Glast and Glt1 mutant mice. In Glast-deficient mice, the electroretinogram b-wave and oscillatory potentials were reduced and retinal damage after ischemia was exacerbated, whereas Glt1-deficient mice showed almost normal electroretinograms and mildly increased retinal damage after ischemia. These results demonstrated that Glast is required for normal signal transmission between photoreceptors and bipolar cells and that both Glast and Glt1 play a neuroprotective role during ischemia in the retina.

[5875] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [5878] Further studies establishing the function and utilities of SLC1A3 are found in John Hopkins OMIM database record ID 600111, and in cited publications numbered 676–682 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BTB (POZ) Domain Containing 3 (BTBD3, Accession NM_014962) is another VGAM196 host target gene. BTBD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of BTBD3 BINDING SITE, designated SEQ ID:1600, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5879] Another function of VGAM196 is therefore inhibition of BTB (POZ) Domain Containing 3 (BTBD3, Accession NM_014962). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD3. KIAA1237 (Accession XM_087386) is another VGAM196 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ ID:3166, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5880] Another function of VGAM196 is therefore inhibition of KIAA1237 (Accession XM_087386). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1237. N-acetylated Alpha-linked Acidic Dipeptidase 2 (NAALAD2, Accession NM_005467) is another VGAM196 host target gene. NAALAD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAALAD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAALAD2 BINDING SITE, designated SEQ ID:1215, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5881] Another function of VGAM196 is therefore inhibition of N-acetylated Alpha-linked Acidic Dipeptidase 2 (NAALAD2, Accession NM_005467). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAALAD2. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM196 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BIND-

ING SITE, designated SEQ ID:1605, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:531.

[5882] Another function of VGAM196 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 197 (VGAM197) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5883] VGAM197 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM197 was detected is described hereinabove with reference to Figs. 1–8.

[5884] VGAM197 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM197 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5885] VGAM197 gene encodes a VGAM197 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM197 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM197 precursor RNA is designated SEQ ID:183, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:183 is located at position 104417 relative to the genome of Vaccinia Virus.

[5886] VGAM197 precursor RNA folds onto itself, forming VGAM197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5887] An enzyme complex designated DICER COMPLEX, `dices` the VGAM197 folded precursor RNA into VGAM197 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM197 RNA is designated SEQ ID:532, and is provided hereinbelow with reference to the sequence listing part.

[5888] VGAM197 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM197 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5889] VGAM197 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM197 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM197 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[5890] The complementary binding of VGAM197 RNA, herein designated VGAM RNA, to host target binding sites on VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM197 host target RNA into VGAM197 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5891] It is appreciated that VGAM197 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM197 host target genes. The mRNA of each one of this plurality of VGAM197 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM197 RNA, herein designated VGAM RNA, and which when bound by VGAM197 RNA causes inhibition of translation of respective one or more VGAM197 host target proteins.

[5892] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM197 gene, herein designated VGAM GENE, on one or more VGAM197 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[5893] It is yet further appreciated that a function of VGAM197 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM197 correlate with, and may be deduced from, the identity of the host target genes which VGAM197 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5894] Nucleotide sequences of the VGAM197 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM197 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM197 are further described hereinbelow with reference to Table 1.

[5895] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM197 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM197 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5896] As mentioned hereinabove with reference to Fig. 1, a function of VGAM197 gene, herein designated VGAM is inhibition of expression of VGAM197 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM197 correlate with, and may be deduced from, the identity of the target genes which VGAM197 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5897] Retinoic Acid Induced 2 (RAI2, Accession NM_021785) is a VGAM197 host target gene. RAI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI2 BINDING SITE, designated SEQ ID:1959, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5898] A function of VGAM197 is therefore inhibition of Retinoic

Acid Induced 2 (RAI2, Accession NM_021785). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI2. Uridine Monophosphate Kinase (UMPK, Accession NM_012474) is another VGAM197 host target gene. UMPK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UMPK BINDING SITE, designated SEQ ID:1436, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5899] Another function of VGAM197 is therefore inhibition of Uridine Monophosphate Kinase (UMPK, Accession NM_012474), a gene which catalyzes the phosphorylation of uridine monophosphate to uridine diphosphate. Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UMPK. The function of UMPK has been established by previous studies. This enzyme (EC 2.7.4.4) catalyzes the first step in the production of the pyrimidine nucleoside triphosphates required for RNA and DNA syn-

thesis, namely the phosphorylation of uridine monophosphate to uridine diphosphate. Giblett et al. (1974) found genetic polymorphism of UMPK by means of starch gel electrophoresis. Family studies provided evidence for 3 alleles--UMPK1, UMPK2, and UMPK3--at an autosomal locus. The UMPK1 allele was associated with about 3 times the catalytic activity of the UMPK2 allele, so that UMPK2 homozygotes are relatively deficient of the enzyme. Two of 3 UMPK2 homozygotes were children with prolonged respiratory infection. This suggested to Giblett et al. (1974) that the ability of immunocompetent lymphocytes to respond to appropriate stimuli is impaired in the UMPK2 homozygote in a manner similar to the immune defect resulting from adenosine deaminase deficiency. Alaskan Eskimos have the highest known prevalence of invasive *Hemophilus influenzae* type B disease, primarily meningitis: in 1 to 5% of all children in the first 2 years of life. In this population a polymorphic variant of UMPK, UMPK-3, is positively associated with invasive HIB disease (relative risk 3.3). No difference in levels of naturally acquired HIB anticapsular antibodies between persons with HIB disease and health controls was found. Thus, the UMPK-3 allele may have a role in mediating nonhumoral

immunity to HIB (Petersen et al., 1985). Giblett et al. (1975) showed that UMPK and Rh (OMIM Ref. No. 111700) are linked (lod score of 2.313 at theta 0.05 on the basis of 4 families). (Rh is located on 1p36.2–p34. Cook and Hamerton (1979) gave 1p32 as the SRO of UMPK.) Satlin et al. (1975) assigned UMPK to chromosome 1 by study of somatic cell hybrids. Using somatic cell hybrids between a mouse cell line deficient in uridine kinase and human cells (Medrano and Green, 1974), Ruddle and Creagan (1975) provisionally assigned UK to chromosome 1. The Goss–Harris method of mapping combined features of recombinational study in families and syntenic tests in hybrid cells. As applied to chromosome 1, the method showed that AK2 and UMPK are distal to PGM1 and that the order of the loci is PGM1: UMPK: (AK2, alpha–FUC): ENO1 (Goss and Harris, 1977). Data on gene frequencies of allelic variants were tabulated by Roychoudhury and Nei (1988).

[5900] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5901] Giblett, E. R.; Anderson, J. E.; Chen, S.–H.; Teng, Y.–S.; Cohen, F. : Uridine monophosphate kinase: a new genetic polymorphism with possible clinical implications. Am. J.

Hum. Genet. 26: 627–635, 1974. ; and

[5902] Roychoudhury, A. K.; Nei, M. : Human Polymorphic Genes: World Distribution. New York: Oxford Univ. Press (pub.) 1988.

[5903] Further studies establishing the function and utilities of UMPK are found in John Hopkins OMIM database record ID 191710, and in cited publications numbered 498, 2989–2992, 190, 2993–2995, 88 and 2996–2997 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 134 (clone pHZ–15) (ZNF134, Accession NM_003435) is another VGAM197 host target gene. ZNF134 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF134 BINDING SITE, designated SEQ ID:1021, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5904] Another function of VGAM197 is therefore inhibition of Zinc Finger Protein 134 (clone pHZ–15) (ZNF134, Accession NM_003435). Accordingly, utilities of VGAM197 in–

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF134. ARL8 (Accession XM_167671) is another VGAM197 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE, designated SEQ ID:3594, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5905] Another function of VGAM197 is therefore inhibition of ARL8 (Accession XM_167671). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. KIAA0546 (Accession XM_049055) is another VGAM197 host target gene. KIAA0546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0546 BINDING SITE, designated SEQ ID:2911, to the nucleotide sequence of

VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5906] Another function of VGAM197 is therefore inhibition of KIAA0546 (Accession XM_049055). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0546. KIAA0644 (Accession NM_014817) is another VGAM197 host target gene. KIAA0644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0644 BINDING SITE, designated SEQ ID:1557, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5907] Another function of VGAM197 is therefore inhibition of KIAA0644 (Accession NM_014817). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0644. KIAA1508 (Accession XM_030209) is another VGAM197 host target gene. KIAA1508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:2614, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5908] Another function of VGAM197 is therefore inhibition of KIAA1508 (Accession XM_030209). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508. 5,10-methenyltetrahydrofolate Synthetase (5-formyltetrahydrofolate cyclo-ligase) (MTHFS, Accession NM_006441) is another VGAM197 host target gene. MTHFS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTHFS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTHFS BINDING SITE, designated SEQ ID:1302, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5909] Another function of VGAM197 is therefore inhibition of 5,10-methenyltetrahydrofolate Synthetase (5-formyltetrahydrofolate cyclo-ligase) (MTHFS, Accession NM_006441). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTHFS. Succinate-CoA Ligase, ADP-forming, Beta Subunit (SUCLA2, Accession NM_003850) is another VGAM197 host target gene. SUCLA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUCLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUCLA2 BINDING SITE, designated SEQ ID:1066, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5910] Another function of VGAM197 is therefore inhibition of Succinate-CoA Ligase, ADP-forming, Beta Subunit (SUCLA2, Accession NM_003850). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUCLA2. LOC149910 (Accession XM_086699) is another VGAM197

host target gene. LOC149910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149910 BINDING SITE, designated SEQ ID:3140, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5911] Another function of VGAM197 is therefore inhibition of LOC149910 (Accession XM_086699). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149910. LOC222171 (Accession XM_166586) is another VGAM197 host target gene. LOC222171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222171 BINDING SITE, designated SEQ ID:3575, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:532.

[5912] Another function of VGAM197 is therefore inhibition of LOC222171 (Accession XM_166586). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222171. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 198 (VGAM198) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5913] VGAM198 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM198 was detected is described hereinabove with reference to Figs. 1–8.

[5914] VGAM198 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5915] VGAM198 gene encodes a VGAM198 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM198

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM198 precursor RNA is designated SEQ ID:184, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:184 is located at position 106759 relative to the genome of Vaccinia Virus.

[5916] VGAM198 precursor RNA folds onto itself, forming VGAM198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5917] An enzyme complex designated DICER COMPLEX, `dices` the VGAM198 folded precursor RNA into VGAM198 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 25%) nucleotide sequence of VGAM198 RNA is designated SEQ ID:533, and is provided hereinbelow with reference to the sequence listing part.

[5918] VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM198 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[5919] VGAM198 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM198 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM198 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5920] The complementary binding of VGAM198 RNA, herein designated VGAM RNA, to host target binding sites on VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM198 host target RNA into VGAM198 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5921] It is appreciated that VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM198 host target genes. The mRNA of each one of this plurality of VGAM198 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM198 RNA, herein designated VGAM RNA, and which when bound by VGAM198 RNA causes inhibition of translation of respective one or more VGAM198 host target proteins.

[5922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM198 gene, herein designated VGAM GENE, on one or more VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5923] It is yet further appreciated that a function of VGAM198 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM198 correlate with, and may be deduced from, the identity of the host target genes which VGAM198 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5924] Nucleotide sequences of the VGAM198 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM198 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM198 are further described hereinbelow with reference to Table 1.

[5925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM198 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM198 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[5926] As mentioned hereinabove with reference to Fig. 1, a function of VGAM198 gene, herein designated VGAM is inhibition of expression of VGAM198 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM198 correlate with, and may be deduced from, the identity of the target genes which VGAM198 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5927] Zinc Finger Protein 24 (KOX 17) (ZNF24, Accession NM_006965) is a VGAM198 host target gene. ZNF24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF24 BINDING SITE, designated SEQ ID:1342, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5928] A function of VGAM198 is therefore inhibition of Zinc Finger Protein 24 (KOX 17) (ZNF24, Accession NM_006965). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ZNF24. Reserved (ALS2CR12, Accession NM_139163) is another VGAM198 host target gene. ALS2CR12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALS2CR12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2CR12 BINDING SITE, designated SEQ ID:2471, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5929] Another function of VGAM198 is therefore inhibition of Reserved (ALS2CR12, Accession NM_139163). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR12. FLJ10508 (Accession NM_018118) is another VGAM198 host target gene. FLJ10508 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10508 BINDING SITE, designated SEQ ID:1783, to the

nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5930] Another function of VGAM198 is therefore inhibition of FLJ10508 (Accession NM_018118). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10508. FLJ13197 (Accession NM_024614) is another VGAM198 host target gene. FLJ13197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:2072, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5931] Another function of VGAM198 is therefore inhibition of FLJ13197 (Accession NM_024614). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197. FLJ21934 (Accession NM_024743) is another VGAM198 host target gene. FLJ21934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ21934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21934 BINDING SITE, designated SEQ ID:2085, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5932] Another function of VGAM198 is therefore inhibition of FLJ21934 (Accession NM_024743). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21934. FLJ23132 (Accession XM_171194) is another VGAM198 host target gene. FLJ23132 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23132 BINDING SITE, designated SEQ ID:3691, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5933] Another function of VGAM198 is therefore inhibition of FLJ23132 (Accession XM_171194). Accordingly, utilities of

VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23132. KIAA0470 (Accession NM_014812) is another VGAM198 host target gene. KIAA0470 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0470 BINDING SITE, designated SEQ ID:1555, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5934] Another function of VGAM198 is therefore inhibition of KIAA0470 (Accession NM_014812). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0470. Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM_015344) is another VGAM198 host target gene. LEPROTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEPROTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LEPROTL1 BINDING SITE, designated SEQ ID:1620, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5935] Another function of VGAM198 is therefore inhibition of Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM_015344). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEPROTL1. Lysosomal Apyrase-like 1 (LYSAL1, Accession NM_004901) is another VGAM198 host target gene. LYSAL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LYSAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYSAL1 BINDING SITE, designated SEQ ID:1164, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5936] Another function of VGAM198 is therefore inhibition of Lysosomal Apyrase-like 1 (LYSAL1, Accession NM_004901). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with LYSAL1. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733) is another VGAM198 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:3229, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5937] Another function of VGAM198 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823) is another VGAM198 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

STK38L BINDING SITE, designated SEQ ID:2845, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5938] Another function of VGAM198 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. Zinc Finger Protein 363 (ZNF363, Accession XM_055989) is another VGAM198 host target gene. ZNF363 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF363 BINDING SITE, designated SEQ ID:2974, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5939] Another function of VGAM198 is therefore inhibition of Zinc Finger Protein 363 (ZNF363, Accession XM_055989). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF363. LOC146481 (Accession

XM_085484) is another VGAM198 host target gene.

LOC146481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146481 BINDING SITE, designated SEQ ID:3093, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5940] Another function of VGAM198 is therefore inhibition of LOC146481 (Accession XM_085484). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146481. LOC152008 (Accession XM_087363) is another VGAM198 host target gene. LOC152008 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152008 BINDING SITE, designated SEQ ID:3165, to the nucleotide sequence of VGAM198 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:533.

[5941] Another function of VGAM198 is therefore inhibition of LOC152008 (Accession XM_087363). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152008. LOC153020 (Accession XM_087578) is another VGAM198 host target gene. LOC153020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153020 BINDING SITE, designated SEQ ID:3178, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5942] Another function of VGAM198 is therefore inhibition of LOC153020 (Accession XM_087578). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153020. LOC199786 (Accession XM_114021) is another VGAM198 host target gene. LOC199786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199786, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:3433, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5943] Another function of VGAM198 is therefore inhibition of LOC199786 (Accession XM_114021). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786. LOC220766 (Accession XM_165471) is another VGAM198 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:3498, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:533.

[5944] Another function of VGAM198 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC220766. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 199 (VGAM199) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5945] VGAM199 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM199 was detected is described hereinabove with reference to Figs. 1–8.

[5946] VGAM199 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM199 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5947] VGAM199 gene encodes a VGAM199 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM199 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM199 precursor RNA is designated SEQ

ID:185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:185 is located at position 106596 relative to the genome of Vaccinia Virus.

[5948] VGAM199 precursor RNA folds onto itself, forming VGAM199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5949] An enzyme complex designated DICER COMPLEX, `dices` the VGAM199 folded precursor RNA into VGAM199 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM199 RNA is designated SEQ ID:534, and is provided hereinbelow with reference to the sequence list-

ing part.

[5950] VGAM199 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM199 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM199 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5951] VGAM199 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM199 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM199 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM199 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM199 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5952] The complementary binding of VGAM199 RNA, herein designated VGAM RNA, to host target binding sites on VGAM199 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM199 host target RNA into VGAM199 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5953] It is appreciated that VGAM199 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM199 host target genes. The mRNA of each one of this plurality of VGAM199 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM199 RNA, herein designated VGAM

RNA, and which when bound by VGAM199 RNA causes inhibition of translation of respective one or more VGAM199 host target proteins.

[5954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM199 gene, herein designated VGAM GENE, on one or more VGAM199 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5955] It is yet further appreciated that a function of VGAM199 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM199 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM199 correlate with, and may be deduced from, the identity of the host target genes which VGAM199 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5956] Nucleotide sequences of the VGAM199 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM199 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM199 are further described hereinbelow with reference to Table 1.

[5957] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM199 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM199 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5958] As mentioned hereinabove with reference to Fig. 1, a function of VGAM199 gene, herein designated VGAM is

inhibition of expression of VGAM199 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM199 correlate with, and may be deduced from, the identity of the target genes which VGAM199 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5959] A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474) is a VGAM199 host target gene. ADAM12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM12 BINDING SITE, designated SEQ ID:1029, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5960] A function of VGAM199 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474), a gene which involved in skeletal muscle regeneration, specifically at the onset of cell fusion. Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with ADAM12. The function of ADAM12 has been established by previous studies. To isolate genes related to fertilin expressed in muscle, Yagami-Hiromasa et al. (1995) amplified cDNAs prepared from a mouse myogenic cell line by PCR using degenerative primers for conserved amino acids between fertilin- α and - β (OMIM Ref. No. 601533). They identified 3 novel mouse sequences, which they called meltrins. Similarly to myogenin, a marker of early muscle differentiation, mouse meltrin- α is expressed in neonatal muscle and bone, and its expression increases dramatically in response to the induction of differentiation. Immunocytochemical localization and functional expression studies suggested that meltrin- α may be involved in myotube formation. Galliano et al. (2000) found by RT-PCR and immunoblot analyses that expression of mouse Adam12 increases during muscle regeneration, while the levels of other ADAMs remain constant. Immunofluorescence analysis revealed staining of small, newly formed muscle fibers in regenerating but not normal adult muscle cells. Using a yeast 2-hybrid screen of a human skeletal muscle cDNA library with the cytoplasmic tail of human ADAM12 as bait, Galliano et al. (2000) determined that the mem-

brane proximal portion of the C-terminal half of myristoylated ADAM12 interacts with muscle-specific alpha-actinin-2 (ACTN2; 102573). Galliano et al. (2000) determined that overexpression of cytosolic ADAM12 containing the ACTN2-binding site inhibits mouse myoblast fusion.

[5961] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5962] Galliano, M.-F.; Huet, C.; Frygeliuss, J.; Polgren, A.; Wewer, U. M.; Engvall, E. : Binding of ADAM12, a marker of skeletal muscle regeneration, to the muscle-specific actin-binding protein, alpha-actinin-2, is required for myoblast fusion. *J. Biol. Chem.* 275: 13933–13939, 2000. ; and

[5963] Yagami-Hiromasa, T.; Sato, T.; Kurisaki, T.; Kamijo, K.; Nabeshima, Y.; Fujisawa-Sehara, A. : A metalloprotease-disintegrin participating in myoblast fusion. *Nature* 377: 652–656, 1995.

[5964] Further studies establishing the function and utilities of ADAM12 are found in John Hopkins OMIM database record ID 602714, and in cited publications numbered 263–265 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box C13

(HOXC13, Accession XM_006804) is another VGAM199 host target gene. HOXC13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC13 BINDING SITE, designated SEQ ID:2538, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5965] Another function of VGAM199 is therefore inhibition of Homeo Box C13 (HOXC13, Accession XM_006804). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC13. Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699) is another VGAM199 host target gene. NRIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRIP1 BINDING SITE, designated SEQ ID:2549, to the nucleotide sequence of

VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5966] Another function of VGAM199 is therefore inhibition of Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699), a gene which modulates transcriptional activation by the estrogen receptor. Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRIP1. The function of NRIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119. Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096) is another VGAM199 host target gene. RRM2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2B BINDING SITE, designated SEQ ID:2798, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5967] Another function of VGAM199 is therefore inhibition of

Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2B. Baculoviral IAP Repeat-containing 4 (BIRC4, Accession NM_001167) is another VGAM199 host target gene. BIRC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIRC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC4 BINDING SITE, designated SEQ ID:806, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5968] Another function of VGAM199 is therefore inhibition of Baculoviral IAP Repeat-containing 4 (BIRC4, Accession NM_001167). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC4. FLJ11301 (Accession NM_018385) is another VGAM199 host target gene. FLJ11301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11301, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11301 BINDING SITE, designated SEQ ID:1822, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5969] Another function of VGAM199 is therefore inhibition of FLJ11301 (Accession NM_018385). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11301. LAP1B (Accession XM_035429) is another VGAM199 host target gene. LAP1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAP1B BINDING SITE, designated SEQ ID:2696, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5970] Another function of VGAM199 is therefore inhibition of LAP1B (Accession XM_035429). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LAP1B. MGC11324 (Accession NM_032717) is another VGAM199 host target gene. MGC11324 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11324 BINDING SITE, designated SEQ ID:2273, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5971] Another function of VGAM199 is therefore inhibition of MGC11324 (Accession NM_032717). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11324. PRO2958 (Accession NM_018546) is another VGAM199 host target gene. PRO2958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2958 BINDING SITE, designated SEQ ID:1841, to the nucleotide

sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5972] Another function of VGAM199 is therefore inhibition of PRO2958 (Accession NM_018546). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2958. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469) is another VGAM199 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:2208, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5973] Another function of VGAM199 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. LOC144997 (Accession XM_096702) is another

VGAM199 host target gene. LOC144997 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144997 BINDING SITE, designated SEQ ID:3271, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5974] Another function of VGAM199 is therefore inhibition of LOC144997 (Accession XM_096702). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144997. LOC148809 (Accession XM_086325) is another VGAM199 host target gene. LOC148809 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148809, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148809 BINDING SITE, designated SEQ ID:3125, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5975] Another function of VGAM199 is therefore inhibition of LOC148809 (Accession XM_086325). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148809. LOC219540 (Accession XM_168047) is another VGAM199 host target gene. LOC219540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219540 BINDING SITE, designated SEQ ID:3612, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:534.

[5976] Another function of VGAM199 is therefore inhibition of LOC219540 (Accession XM_168047). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219540. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 200 (VGAM200) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[5977] VGAM200 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM200 was detected is described hereinabove with reference to Figs. 1–8.

[5978] VGAM200 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM200 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5979] VGAM200 gene encodes a VGAM200 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM200 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM200 precursor RNA is designated SEQ ID:186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:186 is located at position 106423 relative to the genome of Vaccinia Virus.

[5980] VGAM200 precursor RNA folds onto itself, forming VGAM200 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[5981] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM200 folded precursor RNA into VGAM200 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 75%) nucleotide se-
quence of VGAM200 RNA is designated SEQ ID:535, and is
provided hereinbelow with reference to the sequence list-
ing part.

[5982] VGAM200 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM200 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM200 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[5983] VGAM200 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM200 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM200 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM200 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM200 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[5984] The complementary binding of VGAM200 RNA, herein designated VGAM RNA, to host target binding sites on VGAM200 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM200 host target RNA into VGAM200 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5985] It is appreciated that VGAM200 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM200 host target genes. The mRNA of each one of this plurality of VGAM200 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM200 RNA, herein designated VGAM RNA, and which when bound by VGAM200 RNA causes inhibition of translation of respective one or more VGAM200 host target proteins.

[5986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM200 gene, herein designated VGAM GENE, on one or more VGAM200 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[5987] It is yet further appreciated that a function of VGAM200 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM200 correlate with, and may be deduced from, the identity of the host target genes which VGAM200 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [5988] Nucleotide sequences of the VGAM200 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM200 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM200 are further described hereinbelow with reference to Table 1.
- [5989] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM200 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM200 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [5990] As mentioned hereinabove with reference to Fig. 1, a function of VGAM200 gene, herein designated VGAM is inhibition of expression of VGAM200 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM200 correlate with, and may be deduced from, the identity of the target genes which VGAM200 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5991] Prostaglandin E Receptor 3 (subtype EP3) (PTGER3, Accession NM_000957) is a VGAM200 host target gene. PTGER3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGER3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGER3 BINDING SITE, designated SEQ ID:790, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:535.

[5992] A function of VGAM200 is therefore inhibition of Prostaglandin E Receptor 3 (subtype EP3) (PTGER3, Accession NM_000957), a gene which is a G protein-coupled receptor that mediates a variety of physiological and pathophysiological effects. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGER3. The function of PTGER3 has been established by previous studies. Prostaglandin E2 (PGE2) induces uterine contraction by increasing intracellular calcium. To investigate other functions of PGE2 in human uterus, Kotani et al. (2000) isolated 2 prostaglandin E receptor EP3 isoforms by RT-PCR using human uterus poly (A)+ RNA. These EP3

isoforms, named EP3-V and EP3-VI, are composed of 402 and 393 amino acid residues, respectively, which are unique compared with EP3 isoforms of other species. Their N-terminal 359 amino acid residues are identical to those of previously reported human EP3 isoforms, whereas the respective C termini of the 2 isoforms contain a novel amino acid sequence. EP3-V and EP3-VI mRNAs were detected abundantly in human uterus, whereas weak but substantial bands were detected in the lung and kidney in RT-PCR specific for each mRNA. In situ hybridization revealed EP3-V and EP3-VI mRNAs in the human myometrium, but not in the endometrium. The authors concluded that EP3-V and EP3-VI are possibly involved in the proliferation of cells in human myometrium. Animal model experiments lend further support to the function of PTGER3. Fever, a hallmark of disease, is elicited by exogenous pyrogens, i.e., cellular components such as lipopolysaccharide (LPS) of infectious organisms, as well as by noninfectious inflammatory insults. Both stimulate the production of cytokines, such as interleukin-1-beta (IL1B; 147720), that act on the brain as endogenous pyrogens. Fever can be suppressed by aspirin-like antiinflammatory drugs. As these drugs share the ability to inhibit

prostaglandin biosynthesis, it appeared that a prostaglandin is important in fever generation. Whether prostaglandin E2 (PGE2) is a neural mediator of fever has been debated. PGE2 acts by interacting with 4 subtypes of PGE receptors: EP1, EP2, EP3, and EP4. Ushikubi et al. (1998) generated mice lacking each of these receptors by homologous recombination. Only mice lacking the EP3 receptor failed to show a febrile response to PGE2 and to either IL1B or LPS. The results established that PGE2 mediates fever generation in response to both endogenous and exogenous pyrogens by acting at the EP3 receptor.

[5993] It is appreciated that the abovementioned animal model for PTGER3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[5994] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5995] Ushikubi, F.; Segi, E.; Sugimoto, Y.; Murata, T.; Matsuoka, T.; Kobayashi, T.; Hizaki, H.; Tuboi, K.; Katsuyama, M.; Ichikawa, A.; Tanaka, T.; Yoshida, N.; Narumiya, S. : Impaired febrile response in mice lacking the prostaglandin E receptor subtype EP(3). Nature 395: 281–284, 1998. ;

and

- [5996] Kotani, M.; Tanaka, I.; Ogawa, Y.; Suganami, T.; Matsumoto, T.; Muro, S.; Yamamoto, Y.; Sugawara, A.; Yoshimasa, Y.; Sagawa, N.; Narumiya, S.; Nakao, K. : Multiple signal transduction pa.
- [5997] Further studies establishing the function and utilities of PTGER3 are found in John Hopkins OMIM database record ID 176806, and in cited publications numbered 2493, 2494, 2496, 249 and 2498 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (*S. cerevisiae*) (SIRT1, Accession NM_012238) is another VGAM200 host target gene. SIRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT1 BINDING SITE, designated SEQ ID:1416, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:535.
- [5998] Another function of VGAM200 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Ho-

molog 1 (*S. cerevisiae*) (SIRT1, Accession NM_012238), a gene which may function as intracellular regulatory protein with mono-ADP-ribosyltransferase activity. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT1. The function of SIRT1 has been established by previous studies. Vaziri et al. (2001) showed that the SIRT1 protein binds and deacetylates the p53 protein (OMIM Ref. No. 191170) with a specificity for its C-terminal lys382 residue, modification of which is implicated in the activation of p53 as a transcription factor. Expression of wildtype SIRT1 in human cells reduced the transcriptional activity of p53. In contrast, expression of a catalytically inactive SIRT1 protein potentiated p53-dependent apoptosis and radiosensitivity. These results suggested that SIRT1 is involved in the regulation of p53 function via deacetylation. Luo et al. (2001) showed that mammalian SIRT1 physically interacts with p53 and attenuates p53-mediated functions. Nicotinamide (vitamin B3) inhibited an NAD-dependent p53 deacetylation induced by SIRT1 and also enhanced the p53 acetylation levels in vivo. Furthermore, SIRT1 repressed p53-dependent apoptosis in response to DNA damage

and oxidative stress, whereas expression of a SIRT1 point mutant increased the sensitivity of cells in the stress response.

[5999] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6000] Vaziri, H.; Dessain, S. K.; Eaton, E. N.; Imai, S.-I.; Frye, R. A.; Pandita, T. K.; Guarente, L.; Weinberg, R. A. :

hSIR2-SIRT1 functions as an NAD-dependent p53 deacetylase. Cell 107: 149-159, 2001. ; and

[6002] Further studies establishing the function and utilities of SIRT1 are found in John Hopkins OMIM database record ID 604479, and in cited publications numbered 1134-113 and 1143-1147 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10898 (Accession XM_002486) is another VGAM200 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10898, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:2526, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:535.

[6003] Another function of VGAM200 is therefore inhibition of FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 201 (VGAM201) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6004] VGAM201 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM201 was detected is described hereinabove with reference to Figs. 1–8.

[6005] VGAM201 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM201 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[6006] VGAM201 gene encodes a VGAM201 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM201 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM201 precursor RNA is designated SEQ ID:187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:187 is located at position 107873 relative to the genome of Vaccinia Virus.

[6007] VGAM201 precursor RNA folds onto itself, forming VGAM201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6008] An enzyme complex designated DICER COMPLEX, `dices` the VGAM201 folded precursor RNA into VGAM201 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM201 RNA is designated SEQ ID:536, and is provided hereinbelow with reference to the sequence listing part.

[6009] VGAM201 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM201 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6010] VGAM201 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM201 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM201 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6011] The complementary binding of VGAM201 RNA, herein designated VGAM RNA, to host target binding sites on VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM201 host target RNA into VGAM201 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[6012] It is appreciated that VGAM201 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM201 host target genes. The mRNA of each one of this plurality of VGAM201 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM201 RNA, herein designated VGAM RNA, and which when bound by VGAM201 RNA causes inhibition of translation of respective one or more VGAM201 host target proteins.

[6013] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM201 gene, herein designated VGAM GENE, on one or more VGAM201 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6014] It is yet further appreciated that a function of VGAM201 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM201 correlate with, and may be deduced from, the identity of the host target genes which VGAM201 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6015] Nucleotide sequences of the VGAM201 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM201 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM201 are further described hereinbelow with reference to Table 1.

[6016] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM201 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM201 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6017] As mentioned hereinabove with reference to Fig. 1, a function of VGAM201 gene, herein designated VGAM is inhibition of expression of VGAM201 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM201 correlate with, and may be deduced from, the identity of the target genes which VGAM201 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6018] FLJ10511 (Accession NM_018120) is a VGAM201 host target gene. FLJ10511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10511 BINDING SITE, designated SEQ ID:1784, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ

ID:536.

[6019] A function of VGAM201 is therefore inhibition of FLJ10511 (Accession NM_018120). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10511. KIAA1462 (Accession XM_166132) is another VGAM201 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:3521, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:536.

[6020] Another function of VGAM201 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854) is another VGAM201 host target gene. MESDC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

MESDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:2950, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:536.

[6021] Another function of VGAM201 is therefore inhibition of Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2. LOC149620 (Accession XM_086604) is another VGAM201 host target gene. LOC149620 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149620 BINDING SITE, designated SEQ ID:3135, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:536.

[6022] Another function of VGAM201 is therefore inhibition of

LOC149620 (Accession XM_086604). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149620. LOC219988 (Accession XM_166223) is another VGAM201 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:3534, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:536.

[6023] Another function of VGAM201 is therefore inhibition of LOC219988 (Accession XM_166223). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 202 (VGAM202) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[6024] VGAM202 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM202 was detected is described hereinabove with reference to Figs. 1–8.

[6025] VGAM202 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM202 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6026] VGAM202 gene encodes a VGAM202 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM202 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM202 precursor RNA is designated SEQ ID:188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:188 is located at position 108007 relative to the genome of Vaccinia Virus.

[6027] VGAM202 precursor RNA folds onto itself, forming VGAM202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[6028] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM202 folded precursor RNA into VGAM202 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 87%) nucleotide se-
quence of VGAM202 RNA is designated SEQ ID:537, and is
provided hereinbelow with reference to the sequence list-
ing part.

[6029] VGAM202 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM202 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM202 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6030] VGAM202 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM202 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM202 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM202 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM202 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[6031] The complementary binding of VGAM202 RNA, herein designated VGAM RNA, to host target binding sites on VGAM202 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM202 host target RNA into VGAM202 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6032] It is appreciated that VGAM202 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM202 host target genes. The mRNA of each one of this plurality of VGAM202 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM202 RNA, herein designated VGAM RNA, and which when bound by VGAM202 RNA causes inhibition of translation of respective one or more VGAM202 host target proteins.

[6033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM202 gene, herein designated VGAM GENE, on one or

more VGAM202 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6034] It is yet further appreciated that a function of VGAM202 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM202 correlate with, and may be deduced from, the identity of the host target genes which VGAM202 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [6035] Nucleotide sequences of the VGAM202 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM202 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM202 are further described hereinbelow with reference to Table 1.
- [6036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM202 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM202 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [6037] As mentioned hereinabove with reference to Fig. 1, a function of VGAM202 gene, herein designated VGAM is inhibition of expression of VGAM202 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM202 correlate with, and may be deduced from, the identity of the target genes which VGAM202 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [6038] Betaine-homocysteine Methyltransferase 2 (BHMT2, Ac-

cession NM_017614) is a VGAM202 host target gene. BHMT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BHMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHMT2 BINDING SITE, designated SEQ ID:1730, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6039] A function of VGAM202 is therefore inhibition of Betaine-homocysteine Methyltransferase 2 (BHMT2, Accession NM_017614). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHMT2. Collagen, Type XV, Alpha 1 (COL15A1, Accession NM_001855) is another VGAM202 host target gene. COL15A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL15A1 BINDING SITE, designated SEQ ID:862, to the nucleotide

sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6040] Another function of VGAM202 is therefore inhibition of Collagen, Type XV, Alpha 1 (COL15A1, Accession NM_001855), a gene which may be involved in maintaining the structure of connective tissue. Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL15A1. The function of COL15A1 has been established by previous studies. Undulin is a large glycoprotein of the interstitial extracellular matrix. It is restricted to dense and soft connective tissues and is associated with mature collagen fibrils (Schuppan et al., 1990). In SDS-polyacrylamide gels, undulin extracted from tissues has a molecular mass above 1,000 kD; under reducing conditions, it migrates as 270-, 190-, and 180-kD polypeptides. By immunoscreening a human placenta cDNA expression library with antibodies against monkey undulin, Just et al. (1991) isolated 2 partial cDNAs, called UN1 and UN2, which encode the C-terminal portions of 2 undulin isoforms. The sequences of UN1 and UN2 are partly identical, and the authors suggested that they represent differentially spliced undulin transcripts. Northern blot anal-

ysis of human rhabdomyosarcoma cell poly(A) RNA using a probe specific for UN1 detected approximately 4.2-, 6.5-, and 8.5-kb transcripts; a probe specific for UN2 detected a single, approximately 5-kb transcript. The deduced polypeptides contain a differentially spliced von Willebrand factor (VWF; 193400) A domain and the type III homology domains found in fibronectin (OMIM Ref. No. 135600) and tenascin (OMIM Ref. No. 187380). Whereas UN1 has 7 complete and 1 truncated type III homology domains followed by a short proline-rich C-terminal segment, UN2 has 2 complete and 1 incomplete type III homologies followed by a unique acidic C-terminal domain. The authors stated that the mRNAs related to UN1 likely encode the major chains of the undulin molecule

[6041] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6042] Schuppan, D.; Cantaluppi, M. C.; Becker, J.; Veit, A.; Bunte, T.; Troyer, D.; Schuppan, F.; Schmid, M.; Ackermann, R.; Hahn, E. G. : Undulin, an extracellular matrix glycoprotein associated with collagen fibrils. J. Biol. Chem. 265: 8823-8832, 1990. ; and

[6043] Just, M.; Herbst, H.; Hummel, M.; Durkop, H.; Tripier, D.;

Stein, H.; Schuppan, D. : Undulin is a novel member of the fibronectin–tenascin family of extracellular matrix glycoproteins. J.

[6044] Further studies establishing the function and utilities of COL15A1 are found in John Hopkins OMIM database record ID 120325, and in cited publications numbered 2793–2804 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet–derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is another VGAM202 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:1280, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6045] Another function of VGAM202 is therefore inhibition of Platelet–derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet–derived growth factor and has a

tyrosine–protein kinase activity. Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA has been established by previous studies. Considerable insight into the role of the sonic hedgehog (OMIM Ref. No. 600725) pathway in vertebrate development and human cancers came from the discovery that mutations in `patched` (PTCH; 601309) are associated with basal cell nevus syndrome (BCNS; 109400), an autosomal dominant disorder combining developmental anomalies and tumors, particularly basal cell carcinomas (BCCs). Sporadic BCCs, the most common human cancer, consistently have abnormalities in the hedgehog pathway, and often mutations in PTCH. In addition, somatic mutations in `smoothened` (SMOH; 601500), another protein in the hedgehog pathway, occur in sporadic BCCs. The downstream molecule GLI1 (OMIM Ref. No. 165220) is known to mediate the biologic effect of the hedgehog pathway and is itself upregulated in all BCCs. Gli1 can drive the production of BCCs in the mouse when overexpressed in the epidermis. Xie et al. (2001) showed that GLI1 can activate PDGFR–alpha and that functional upregulation of PDGFR–alpha by GLI1 is accompanied by activa–

tion of the Ras-ERK pathway, which is associated with cell proliferation. The relevance of this mechanism in vivo is supported by a high level of expression of PDGFR-alpha in BCCs in mice and humans. From these and other observations, Xie et al. (2001) concluded that increased expression of the PDGFR-alpha gene may be an important mechanism by which mutations in the hedgehog pathway cause BCCs. Animal model experiments lend further support to the function of PDGFRA. Klinghoffer et al. (2001) created 2 complementary lines of knockin mice in which the intracellular signaling domains of one PDGFR had been removed and replaced by those of the other PDGFR. While both lines demonstrated substantial rescue of normal development, substitution of the *Pdgfrb* signaling domains with those of *Pdgfra* resulted in varying degrees of vascular disease.

[6046] It is appreciated that the abovementioned animal model for PDGFRA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6048] Xie, J.; Aszterbaum, M.; Zhang, X.; Bonifas, J. M.; Zachary, C.; Epstein, E.; McCormick, F. : A role of PDGFR- α in basal cell carcinoma proliferation. Proc. Nat. Acad. Sci. 98: 9255–9259, 2001. ; and

[6049] Klinghoffer, R. A.; Mueting–Nelsen, P. F.; Faerman, A.; Shani, M.; Soriano, P. : The two PDGF receptors maintain conserved signaling in vivo despite divergent embryological functions.

[6050] Further studies establishing the function and utilities of PDGFRA are found in John Hopkins OMIM database record ID 173490, and in cited publications numbered 3000–3001, 2452, 3002–3005, 3051, 83 and 833–298 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DORFIN (Accession NM_015435) is another VGAM202 host target gene. DORFIN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DORFIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DORFIN BINDING SITE, designated SEQ ID:1631, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ

ID:537.

[6051] Another function of VGAM202 is therefore inhibition of DORFIN (Accession NM_015435). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DORFIN. FLJ20034 (Accession NM_017630) is another VGAM202 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:1732, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6052] Another function of VGAM202 is therefore inhibition of FLJ20034 (Accession NM_017630). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. KIAA0831 (Accession NM_014924) is another VGAM202 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:1589, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6053] Another function of VGAM202 is therefore inhibition of KIAA0831 (Accession NM_014924). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831. MBLL39 (Accession NM_005757) is another VGAM202 host target gene. MBLL39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBLL39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE, designated SEQ ID:1243, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6054] Another function of VGAM202 is therefore inhibition of MBLL39 (Accession NM_005757). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MBLL39. TSP-NY (Accession NM_032573) is another VGAM202 host target gene. TSP-NY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSP-NY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSP-NY BINDING SITE, designated SEQ ID:2261, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6055] Another function of VGAM202 is therefore inhibition of TSP-NY (Accession NM_032573). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSP-NY. LOC112840 (Accession NM_080666) is another VGAM202 host target gene. LOC112840 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112840 BINDING SITE, designated SEQ ID:2384, to the nucleotide sequence

of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6056] Another function of VGAM202 is therefore inhibition of LOC112840 (Accession NM_080666). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112840. LOC136895 (Accession NM_138811) is another VGAM202 host target gene. LOC136895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC136895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136895 BINDING SITE, designated SEQ ID:2458, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6057] Another function of VGAM202 is therefore inhibition of LOC136895 (Accession NM_138811). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136895. LOC145790 (Accession XM_085234) is another VGAM202 host target gene. LOC145790 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145790 BINDING SITE, designated SEQ ID:3083, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6058] Another function of VGAM202 is therefore inhibition of LOC145790 (Accession XM_085234). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145790. LOC151040 (Accession XM_087082) is another VGAM202 host target gene. LOC151040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151040 BINDING SITE, designated SEQ ID:3153, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6059] Another function of VGAM202 is therefore inhibition of LOC151040 (Accession XM_087082). Accordingly, utilities

of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151040. LOC157869 (Accession XM_088409) is another VGAM202 host target gene. LOC157869 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157869, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157869 BINDING SITE, designated SEQ ID:3207, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6060] Another function of VGAM202 is therefore inhibition of LOC157869 (Accession XM_088409). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157869. LOC222028 (Accession XM_168382) is another VGAM202 host target gene. LOC222028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC222028 BINDING SITE, designated SEQ ID:3631, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6061] Another function of VGAM202 is therefore inhibition of LOC222028 (Accession XM_168382). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222028. LOC222252 (Accession XM_168640) is another VGAM202 host target gene. LOC222252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222252 BINDING SITE, designated SEQ ID:3652, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:537.

[6062] Another function of VGAM202 is therefore inhibition of LOC222252 (Accession XM_168640). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222252. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 203 (VGAM203) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6063] VGAM203 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM203 was detected is described hereinabove with reference to Figs. 1–8.

[6064] VGAM203 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6065] VGAM203 gene encodes a VGAM203 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM203 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM203 precursor RNA is designated SEQ ID:189, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:189 is located at position 108588 relative to the genome of Vac–

cinia Virus.

[6066] VGAM203 precursor RNA folds onto itself, forming VGAM203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6067] An enzyme complex designated DICER COMPLEX, `dices` the VGAM203 folded precursor RNA into VGAM203 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM203 RNA is designated SEQ ID:538, and is provided hereinbelow with reference to the sequence listing part.

[6068] VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM203 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6069] VGAM203 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM203 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM203 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6070] The complementary binding of VGAM203 RNA, herein designated VGAM RNA, to host target binding sites on VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM203 host target RNA into VGAM203 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6071] It is appreciated that VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM203 host target genes. The mRNA of each one of this plurality of VGAM203 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM203 RNA, herein designated VGAM RNA, and which when bound by VGAM203 RNA causes inhibition of translation of respective one or more VGAM203 host target proteins.

[6072] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM203 gene, herein designated VGAM GENE, on one or more VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6073] It is yet further appreciated that a function of VGAM203 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM203 correlate

with, and may be deduced from, the identity of the host target genes which VGAM203 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6074] Nucleotide sequences of the VGAM203 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM203 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM203 are further described hereinbelow with reference to Table 1.

[6075] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM203 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM203 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6076] As mentioned hereinabove with reference to Fig. 1, a function of VGAM203 gene, herein designated VGAM is inhibition of expression of VGAM203 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM203 correlate with, and may be deduced

from, the identity of the target genes which VGAM203 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6077] FLJ20485 (Accession NM_019042) is a VGAM203 host target gene. FLJ20485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20485 BINDING SITE, designated SEQ ID:1875, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:538.

[6078] A function of VGAM203 is therefore inhibition of FLJ20485 (Accession NM_019042). Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20485. LOC132617 (Accession XM_067939) is another VGAM203 host target gene. LOC132617 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC132617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC132617 BINDING SITE, designated SEQ ID:3040, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:538.

[6079] Another function of VGAM203 is therefore inhibition of LOC132617 (Accession XM_067939). Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132617. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 204 (VGAM204) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6080] VGAM204 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM204 was detected is described hereinabove with reference to Figs. 1–8.

[6081] VGAM204 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[6082] VGAM204 gene encodes a VGAM204 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM204 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM204 precursor RNA is designated SEQ ID:190, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:190 is located at position 108944 relative to the genome of Vaccinia Virus.

[6083] VGAM204 precursor RNA folds onto itself, forming VGAM204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6084] An enzyme complex designated DICER COMPLEX, `dices` the VGAM204 folded precursor RNA into VGAM204 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM204 RNA is designated SEQ ID:539, and is provided hereinbelow with reference to the sequence listing part.

[6085] VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM204 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6086] VGAM204 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM204 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM204 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6087] The complementary binding of VGAM204 RNA, herein designated VGAM RNA, to host target binding sites on VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM204 host target RNA into VGAM204 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6088] It is appreciated that VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM204 host target genes. The mRNA of each one of this plurality of VGAM204 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM204 RNA, herein designated VGAM RNA, and which when bound by VGAM204 RNA causes inhibition of translation of respective one or more VGAM204 host target proteins.

[6089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM204 gene, herein designated VGAM GENE, on one or more VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6090] It is yet further appreciated that a function of VGAM204 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM204 correlate with, and may be deduced from, the identity of the host target genes which VGAM204 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6091] Nucleotide sequences of the VGAM204 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM204 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM204 are further described hereinbelow with reference to Table 1.

[6092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM204 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM204 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6093] As mentioned hereinabove with reference to Fig. 1, a function of VGAM204 gene, herein designated VGAM is inhibition of expression of VGAM204 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM204 correlate with, and may be deduced from, the identity of the target genes which VGAM204 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6094] Period Homolog 2 (Drosophila) (PER2, Accession NM_022817) is a VGAM204 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:2013, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6095] A function of VGAM204 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 has been established by previous studies. To investigate the biologic role of NPAS2 (OMIM Ref. No. 603347), Reick et al. (2001) prepared a neuroblastoma cell line capable of conditional induction of the NPAS2:BMAL1 (OMIM Ref. No. 602550) heterodimer and identified putative target genes by representational difference analysis, DNA microarrays, and Northern blotting. Coinduction of NPAS2 and BMAL1 activated transcription of the endogenous Per1, Per2, and Cry1 (OMIM Ref. No. 601933) genes, which encode negatively activating components of the circadian regulatory apparatus, and repressed transcription of the endogenous BMAL1 gene. Analysis of the frontal cortex of wildtype mice kept in a 24-hour light-dark cycle revealed that Per1, Per2, and Cry1 mRNA levels were elevated during darkness and reduced during light, whereas BMAL1 mRNA displayed the opposite pattern. In situ hybridization assays of mice kept

in constant darkness revealed that Per2 mRNA abundance did not oscillate as a function of circadian cycle in NPAS2-deficient mice. Thus, NPAS2 likely functions as part of a molecular clock operative in the mammalian forebrain. Animal model experiments lend further support to the function of PER2. Shearman et al. (2000) demonstrated that in the mouse, the core mechanism for the master circadian clock consists of interacting positive and negative transcription and translation feedback loops. Analysis of Clock/Clock (OMIM Ref. No. 601851) mutant mice, homozygous Per2 mutants, and Cry-deficient mice revealed substantially altered Bmal1 (OMIM Ref. No. 602550) rhythms, consistent with a dominant role of Per2 in the positive regulation of the Bmal1 loop. In vitro analysis of Cry inhibition of Clock:Bmal1-mediated transcription shows that the inhibition is through direct protein-protein interactions, independent of the Per and Tim (OMIM Ref. No. 603887) proteins. Per2 is a positive regulator of the Bmal1 loop, and Cry1 and Cry2 are the negative regulators of the Period and Cryptochrome cycles.

[6096] It is appreciated that the abovementioned animal model for PER2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[6097] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6098] Shearman, L. P.; Sriram, S.; Weaver, D. R.; Maywood, E. S.; Chaves, I.; Zheng, B.; Kume, K.; Lee, C. C.; van der Horst, G. T. J.; Hastings, M. H.; Reppert, S. M. : Interacting molecular loops in the mammalian circadian clock. *Science* 288: 1013–1019, 2000. ; and

[6099] Shearman, L. P.; Zylka, M. J.; Weaver, D. R.; Kolakowski, L. F., Jr.; Reppert, S. M. : Two period homologs: circadian expression and photic regulation in the suprachiasmatic nuclei. *Neu.*

[6100] Further studies establishing the function and utilities of PER2 are found in John Hopkins OMIM database record ID 603426, and in sited publications numbered 213–214, 1451–1452, 312, 1865–186 and 1962 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163) is another VGAM204 host target gene. SLC14A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC14A2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:1360, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6101] Another function of VGAM204 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163), a gene which is a renal urea transporter 2. Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A2. The function of SLC14A2 has been established by previous studies. Genetic variation in proteins that determine sodium reabsorption and excretion significantly influences blood pressure. Ranade et al. (2001) investigated whether nucleotide variation in human UT2 could be associated with variation in blood pressure. Seven single-nucleotide polymorphisms (SNPs) were identified, including val227 to ile and ala357 to thr. Over 1,000 hypertensive and low-normotensive individuals of Chinese origin were genotyped. The ile227 and ala357 alleles were associated with low diastolic blood pressure in men but not women, with

odds ratios 2.1 (95% confidence interval 1.5–2.7, P less than 0.001) and 1.5 (95% confidence interval 1.2–1.8, P less than 0.001), respectively. There was a similar trend for systolic blood pressure, and odds ratios for the ile227 and ala357 alleles were 1.7 (95% confidence interval 1.2–2.3, P = 0.002) and 1.3 (95% confidence interval 1.1–1.6, P = 0.007), respectively, in men. DeStefano et al. (1998) identified a locus for orthostatic hypotension (OHDS; 143850) on chromosome 18q, with a peak lod score of 3.92 at D18S1367 in 2 linked families. The proximity of human UT2 makes it a potential candidate gene for this autosomal dominant disorder.

[6102] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6103] Ranade, K.; Wu, K.-W.; Hwu, C.-M.; Ting, C.-T.; Pei, D.; Pesich, R.; Hebert, J.; Chen, Y.-D. I.; Pratt, R.; Olshen, R.; Masaki, K.; Risch, N.; Cox, D. R.; Botstein, D. : Genetic variation in the human urea transporter-2 is associated with variation in blood pressure. *Hum. Molec. Genet.* 10: 2157–2164, 2001. ; and

[6104] DeStefano, A. L.; Baldwin, C. T.; Burzstyn, M.; Gavras, I.; Handy, D. E.; Joost, O.; Martel, T.; Nicolaou, M.; Schwartz,

F.; Streeten, D. H. P.; Farrer, L. A.; Gavras, H. : Autosomal domin.

[6105] Further studies establishing the function and utilities of SLC14A2 are found in John Hopkins OMIM database record ID 601611, and in cited publications numbered 2819–2052 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 82 (C20orf82, Accession XM_097736) is another VGAM204 host target gene. C20orf82 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf82, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf82 BINDING SITE, designated SEQ ID:3316, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6106] Another function of VGAM204 is therefore inhibition of Chromosome 20 Open Reading Frame 82 (C20orf82, Accession XM_097736). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf82. DK–

FZp566D234 (Accession XM_030162) is another VGAM204 host target gene. DKFZp566D234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D234 BINDING SITE, designated SEQ ID:2610, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6107] Another function of VGAM204 is therefore inhibition of DKFZp566D234 (Accession XM_030162). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D234. EFS2 (Accession NM_005864) is another VGAM204 host target gene. EFS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFS2 BINDING SITE, designated SEQ ID:1257, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also

designated SEQ ID:539.

[6108] Another function of VGAM204 is therefore inhibition of EFS2 (Accession NM_005864). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFS2. FLJ13194 (Accession NM_025146) is another VGAM204 host target gene. FLJ13194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13194 BINDING SITE, designated SEQ ID:2140, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6109] Another function of VGAM204 is therefore inhibition of FLJ13194 (Accession NM_025146). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13194. Zinc Finger Protein 291 (ZNF291, Accession NM_020843) is another VGAM204 host target gene. ZNF291 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF291, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF291 BINDING SITE, designated SEQ ID:1930, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6110] Another function of VGAM204 is therefore inhibition of Zinc Finger Protein 291 (ZNF291, Accession NM_020843). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF291. LOC157503 (Accession XM_098767) is another VGAM204 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:3380, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6111] Another function of VGAM204 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities

of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. LOC254431 (Accession XM_173024) is another VGAM204 host target gene. LOC254431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254431 BINDING SITE, designated SEQ ID:3716, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:539.

[6112] Another function of VGAM204 is therefore inhibition of LOC254431 (Accession XM_173024). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254431. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 205 (VGAM205) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6113] VGAM205 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM205 was detected is described hereinabove with reference to Figs. 1–8.

[6114] VGAM205 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM205 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6115] VGAM205 gene encodes a VGAM205 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM205 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM205 precursor RNA is designated SEQ ID:191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:191 is located at position 108758 relative to the genome of Vaccinia Virus.

[6116] VGAM205 precursor RNA folds onto itself, forming VGAM205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6117] An enzyme complex designated DICER COMPLEX, `dices` the VGAM205 folded precursor RNA into VGAM205 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM205 RNA is designated SEQ ID:540, and is provided hereinbelow with reference to the sequence listing part.

[6118] VGAM205 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM205 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[6119] VGAM205 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM205 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM205 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6120] The complementary binding of VGAM205 RNA, herein designated VGAM RNA, to host target binding sites on VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM205 host target RNA into VGAM205 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6121] It is appreciated that VGAM205 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM205 host target genes. The mRNA of each one of this plurality of VGAM205 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM205 RNA, herein designated VGAM RNA, and which when bound by VGAM205 RNA causes inhibition of translation of respective one or more VGAM205 host target proteins.

[6122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM205 gene, herein designated VGAM GENE, on one or more VGAM205 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6123] It is yet further appreciated that a function of VGAM205 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM205 correlate with, and may be deduced from, the identity of the host target genes which VGAM205 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6124] Nucleotide sequences of the VGAM205 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM205 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM205 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM205 are further
described hereinbelow with reference to Table 1.

[6125] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM205 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM205 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[6126] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM205 gene, herein designated VGAM is
inhibition of expression of VGAM205 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM205 correlate with, and may be deduced
from, the identity of the target genes which VGAM205
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[6127] Breast Cancer 1, Early Onset (BRCA1, Accession
NM_007306) is a VGAM205 host target gene. BRCA1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE, designated SEQ ID:1390, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6128] A function of VGAM205 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM_007306). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Chromosome 18 Open Reading Frame 1 (C18orf1, Accession XM_012723) is another VGAM205 host target gene. C18orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C18orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C18orf1 BINDING SITE, designated SEQ ID:2562, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6129] Another function of VGAM205 is therefore inhibition of Chromosome 18 Open Reading Frame 1 (C18orf1, Accession XM_012723), a gene which displays selective expression, regulated spatially and temporally. Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C18orf1. The function of C18orf1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM156. Centaurin, Delta 1 (CENTD1, Accession NM_015230) is another VGAM205 host target gene. CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENTD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2, designated SEQ ID:1614 and SEQ ID:2473 respectively, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6130] Another function of VGAM205 is therefore inhibition of Centaurin, Delta 1 (CENTD1, Accession NM_015230), a gene which is involved in cell signaling/communication. Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD1. The function of CENTD1 has been established by previous studies. By screening brain cDNAs for the potential to encode proteins that are at least 50 kD, Nagase et al. (1998) identified a partial cDNA encoding CENTD1, which they called KIAA0580. The protein was predicted to be involved in cell signaling/communication. RT-PCR analysis detected expression of KIAA0580 in all tissues tested except skeletal muscle. By searching sequence databases, followed by 5-prime RACE, Miura et al. (2002) obtained full-length cDNAs encoding CENTD1 and CENTD2 (OMIM Ref. No. 606646), which they called ARAP2 and ARAP1, respectively. Like ARAP1, the 1,704-amino acid ARAP2 protein contains ARF-GAP (see OMIM Ref. No. 103180), RHO-GAP (see OMIM Ref. No. 602732), ankyrin repeat (see OMIM Ref. No. 605787), RAS (OMIM Ref. No. 190020)-associating, and 5 pleckstrin (OMIM Ref. No. 173570) homology (PH) domains. However, unlike ARAP1, ARAP2 also has a sterile alpha motif

(SAM) domain like that found in EphA receptor (see OMIM Ref. No. 179610) and a region of homology to the switch-2 domain of RAB13 (OMIM Ref. No. 602672). The RHO-GAP domain of ARAP2 lacks the predicted catalytic arginine and is therefore unlikely to have RHO-GAP activity. Northern blot analysis showed that ARAP2 is much more variably expressed than ARAP1. The highest ARAP2 expression levels were in brain, thymus, spleen, kidney, peripheral blood leukocytes, lymph node, spinal cord, and thyroid. Two messages at 7.5 and 11 kb were found in brain, and 7.5- and 8.5-kb messages were found in thymus, spleen, kidney, peripheral blood leukocytes, and lymph node. Of the hematopoietic tissues examined, only bone marrow did not show ARAP2 expression.

[6131] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6132] Miura, K.; Jacques, K. M.; Stauffer, S.; Kubosaki, A.; Zhu, K.; Hirsch, D. S.; Resau, J.; Zheng, Y.; Randazzo, P. A. : ARAP1: a point of convergence for Arf and Rho signaling. *Molec. Cell* 9: 109-119, 2002. ; and

[6133] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding se-

quences of unidentified human genes. IX. The complete sequences of 10.

[6134] Further studies establishing the function and utilities of CENTD1 are found in John Hopkins OMIM database record ID 606645, and in cited publications numbered 141 and 1563 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EPB72 (Accession NM_004099) is another VGAM205 host target gene. EPB72 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:1086, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6135] Another function of VGAM205 is therefore inhibition of EPB72 (Accession NM_004099), a gene which may regulate cation conductance. Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB72. The function of EPB72 has been established by previous studies. Erythro-

cyte surface protein band 7.2 is a 29,000-kD integral membrane protein that is exposed on the cytoplasmic surface of the membrane and is susceptible to phosphorylation by a cAMP-dependent protein kinase. Deficiency of this protein in red cells is responsible for stomatocytosis (OMIM Ref. No. 185000). The same protein can be demonstrated in human cell lines of epithelial and lymphoid origin, notably in HeLa cells. Hiebl-Dirschmied et al. (1991), therefore, could screen HeLa cell cDNA expression libraries with antibodies to the protein in order to isolate cDNA clones, determine the nucleotide sequence, and study the structure of the protein. HeLa and bone marrow cell-derived sequences were identical, except for one nucleotide; the deduced sequence of 287 amino acids was confirmed by sequence identity with peptides of the erythroid protein. Structural analysis assigned band 7 protein to the type Ib transmembrane proteins. Westberg et al. (1993) used a cDNA clone coding for stomatin to determine the chromosomal localization of the EPB72 gene. They assigned the gene to human chromosome 9 by Southern blot analysis of somatic cell hybrids. By analysis of hybrid cells containing only parts of chromosome 9, they regionalized the assignment to 9q34.1, proximal to

the breakpoint that creates the Philadelphia chromosome of chronic myeloid leukemia (CML; 151410) and, therefore, proximal to the Abelson oncogene (OMIM Ref. No. 189980). Using fluorescence in situ hybridization, Gallagher et al. (1993) likewise mapped the EPB72 gene to 9q33–q34. They showed that EPB72 was not translocated with the 3–prime end of the ABL gene in the Philadelphia chromosome, suggesting that the EPB72 gene is centromeric to the ABL gene. Pilz et al. (1994) demonstrated that the homologous gene is located on mouse chromosome 2. To gain additional insight into the structure and function of this protein, Gallagher et al. (1995) cloned the mouse band 7.2b cDNA and studied its tissue-specific expression. They isolated 2,873 bp of cDNA with an open reading frame of 852 bp. The predicted protein was 284 amino acids with a molecular weight of 31 kD. They detected a wide pattern of expression, with high levels of mRNA in heart, liver, skeletal muscle, and testis but low levels in lung, brain, and spleen. Using fluorescence in situ hybridization, the murine band 7.2b gene was mapped to chromosome 2, at the border of the distal region of 2B and proximal region of C1, syntenic to 9q, the location of the human homolog. Models of the predicted

protein structure showed a short NH₂-terminal head, a strongly hydrophobic 28-amino acid stretch presumably encoding a single membrane-spanning domain, and a large domain composed of beta sheet and alpha helix. Database searching showed no significant homology of other known proteins to either the human or the murine band 7.2b. Gallagher and Forget (1995) determined the sequence of the full-length human band 7.2b cDNA, characterized the genomic structure of the EPB72 gene, studied its pattern of expression in different tissues, and characterized the promoter of the gene. The gene is composed of 7 exons distributed over 40 kb of DNA. Its promoter was identified as lacking a TATA box and to be GC-rich. It directed high-level expression of a reporter gene in both erythroid and non-erythroid cells. Unfried et al. (1995) showed that the human EPB72 gene contains 7 exons spanning about 30 kb. Two polyadenylation signals were found in the 3-prime UTR accounting for the 3.2- and 3.3-kb RNAs that are observed in Northern blots. Animal model experiments lend further support to the function of EPB72. To examine the relationship between erythrocyte membrane protein 7.2b deficiency and the hemolytic anemia of human hereditary stomatocytosis,

Zhu et al. (1999) created 7.2b knockout mice by standard gene targeting approaches. Despite a complete absence of protein 7.2b in homozygous knockout mice, there was no hemolytic anemia, and mouse red blood cells were normal in morphology, cell indices, hydration status, monovalent cation content, and ability to translocate lipids. Thus, their experiments suggested that 7.2b deficiency plays no direct role in the etiology of stomatocytosis and excluded any role of this protein as a mediator of cation transport in red blood cells.

[6136] It is appreciated that the abovementioned animal model for EPB72 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6137] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6138] Zhu, Y.; Paszty, C.; Turetsky, T.; Tsai, S.; Kuypers, F. A.; Lee, G.; Cooper, P.; Gallagher, P. G.; Stevens, M. E.; Rubin, E.; Mohandas, N.; Mentzer, W. C. : Stomatocytosis is absent in 'stomatin'-deficient murine red blood cells. Blood 93: 2404-2410, 1999. ; and

[6139] Zhu, Y.; Paszty, C.; Turetsky, T.; Tsai, S.; Kuypers, F. A.;

Lee, G.; Cooper, P.; Gallagher, P. G.; Stevens, M. E.; Rubin, E.; Mohandas, N.; Mentzer, W. C. : Stomatocytosis is absent in.

[6140] Further studies establishing the function and utilities of EPB72 are found in John Hopkins OMIM database record ID 133090, and in cited publications numbered 960–967 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanylate Binding Protein 1, Interferon–inducible, 67kDa (GBP1, Accession NM_002053) is another VGAM205 host target gene. GBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBP1 BINDING SITE, designated SEQ ID:894, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6141] Another function of VGAM205 is therefore inhibition of Guanylate Binding Protein 1, Interferon–inducible, 67kDa (GBP1, Accession NM_002053), a gene which specifically binds guanylate nucleotides (GMP, GDP and GTP). Accordingly, utilities of VGAM205 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with GBP1. The function of GBP1 has been established by previous studies. Interferons are cytokines that have antiviral effects and inhibit tumor cell proliferation. They induce a large number of genes in their target cells, including those coding for the guanylate-binding proteins (GBPs). GBPs are characterized by their ability to specifically bind guanine nucleotides (GMP, GDP, and GTP) and are distinguished from the GTP-binding proteins by the presence of 2 binding motifs rather than 3. Cheng et al. (1991) cloned the cDNAs for GBP1 (a 67-kD protein) and GBP2 (partial cDNA; 600412). Strehlow et al. (1994) identified the human GBP1 gene and showed that it contains 11 exons. By use of somatic cell hybrid DNAs, they mapped the gene to human chromosome 1. A mouse homolog of GBP1 has been mapped to the distal region of mouse chromosome 3 (Prochazka et al., 1985). Strehlow et al. (1994) also identified and partially characterized a third novel member of the family (GBP3; 600413) which shows significant sequence similarity to both GBP1 and GBP2. The putative window of embryo implantation in the human opens between days 19 to 24 of the menstrual cycle. A major challenge in the study of human reproduction

is to identify the molecular signals that participate in the establishment of this critical receptive phase in the context of the natural cycle. Toward this goal, Kumar et al. (2001) analyzed human endometrial biopsies at various days of the menstrual cycle by mRNA differential display. They isolated several cDNAs representing genes that are either up- or downregulated within the putative window of implantation. They identified one of these genes as GBP1, which possesses GTPase activity. Analysis of endometrial biopsies by Northern blot and RT-PCR demonstrated that GBP1 mRNA is specifically induced at the mid-secretory phase of the menstrual cycle. In situ hybridization analysis revealed that GBP1 mRNA expression is localized in the glandular epithelial cells as well as in the stroma in the immediate vicinity of the glands. The authors concluded that its unique expression overlapping the putative window of implantation suggests that GBP1 may serve as a useful marker of uterine receptivity in the human.

[6142] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6143] Cheng, Y.-S. E.; Patterson, C. E.; Staeheli, P. : Interferon-in-

duced guanylate-binding proteins lack an N(T)KXD consensus motif and bind GMP in addition to GDP and GTP. Molec. Cell. Biol. 11: 4717-4725, 1991. ; and

[6144] Kumar, S.; Li, Q.; Dua, A.; Ying, Y.-K.; Bagchi, M. K.; Bagchi, I. C. : Messenger ribonucleic acid encoding interferon-inducible guanylate binding protein 1 is induced in human endometri.

[6145] Further studies establishing the function and utilities of GBP1 are found in John Hopkins OMIM database record ID 600411, and in cited publications numbered 2214-2217 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Matrix Metalloproteinase 2 (gelatinase A, 72kDa gelatinase, 72kDa type IV collagenase) (MMP2, Accession NM_004530) is another VGAM205 host target gene. MMP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP2 BINDING SITE, designated SEQ ID:1124, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6146] Another function of VGAM205 is therefore inhibition of Matrix Metalloproteinase 2 (gelatinase A, 72kDa gelatinase, 72kDa type IV collagenase) (MMP2, Accession NM_004530). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP2. Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM_013385) is another VGAM205 host target gene. PSCD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSCD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSCD4 BINDING SITE, designated SEQ ID:1447, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6147] Another function of VGAM205 is therefore inhibition of Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM_013385), a gene which promotes guanine-nucleotide exchange on arf1 and arf5. Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSCD4. The function of PSCD4 has been estab-

lished by previous studies. ADP-ribosylation factors, or ARFS (see OMIM Ref. No. ARF1; 103180), are small GTP-binding proteins within the Ras superfamily that regulate vesicle trafficking in eukaryotic cells. ARF1 recruits coat proteins (e.g., COPA; 601924) to membranes on the cytoplasmic face of the Golgi apparatus. The PSCD proteins (e.g., PSCD1; 182115), a family of proteins containing a C-terminal pleckstrin homology (PH) domain and a central 200-amino acid region similar to a domain within the yeast Sec7 protein, which is required for vesicular traffic of polypeptides through the Golgi, function as guanine-nucleotide exchange factors (GEFs) for ARFs. Klarlund et al. (1997) identified a cDNA encoding mouse Grp1 (general receptor for phosphoinositides-1) by screening mouse adipocyte and brain cDNA expression libraries with phosphoinositide probes. By searching an EST database for sequences similar to mouse brain Grp1, followed by PCR and screening of a human blood cDNA library, Venkateswarlu et al. (1998) obtained a cDNA encoding PSCD3, which they called GRP1. Sequence analysis showed that the predicted 399-amino acid PSCD3 protein contains a 39-amino acid coiled-coil domain, a 172-amino acid Sec7 domain, and a 118-amino acid PH domain. PSCD3

shares 82.7% and 79.5% amino acid identity with PSCD1 and PSCD2 (OMIM Ref. No. 602488), respectively, as well as 98.8% identity with mouse Grp1. By Scatchard and mutational analyses, Venkateswarlu et al. (1998) determined that PSCD3 binds via its PH domain to the inositol head group of phosphatidylinositol 3,4,5-triphosphate with high affinity. Confocal laser microscopy demonstrated that stimulation of cells with either epidermal growth factor (EGF; 131530) or nerve growth factor (NGF; 162030) results in PH domain-dependent translocation of PSCD3 from the cytosol to the plasma membrane. The translocation was rapid and transient with EGF, whereas NGF mediated a relatively longer translocation. By searching an EST database for Sec7 domain-related sequences and by screening a placenta cDNA library, Franco et al. (1998) isolated a cDNA encoding PSCD3, which they called ARNO3. Northern blot analysis revealed that PSCD3, in contrast to the ubiquitously expressed PSCD1 and PSCD2, is expressed as a 4.5-kb transcript that is almost absent from liver, thymus, and peripheral blood lymphocytes. Franco et al. (1998) found that PSCD3, like PSCD1 and PSCD2, shows GEF activity, mediated by the Sec7 domain, towards ARF1 but not ARF6 (OMIM Ref. No. 600464). Im-

munofluorescence microscopy indicated that overexpression of PSCD3 induces major morphologic alterations of the Golgi apparatus, including redistribution of Golgi resident proteins and the coat protein COPB (OMIM Ref. No. 600959). Lietzke et al. (2000) and Ferguson et al. (2000) determined the structure of the GRP1 PH domain in the unliganded form and bound to inositol 1,3,4,5-tetraphosphate. Lietzke et al. (2000) found that a novel mode of phosphoinositide recognition involving a 20-residue insertion within the beta-6/beta-7 loop explains the unusually high specificity of the GRP1 PH domain and the promiscuous 3-phosphoinositide binding typical of several other PH domains, including that of protein kinase B (AKT1; 164730). By comparing the GRP1 PH domain to other PH domains, general determinants of 3-phosphoinositide recognition and specificity could be deduced.

[6148] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6149] Ferguson, K. M.; Kavran, J. M.; Sankaran, V. G.; Fournier, E.; Isakoff, S. J.; Skolnik, E. Y.; Lemmon, M. A. : Structural basis for discrimination of 3-phosphoinositides by pleck-

strin homology domains. Molec. Cell 6: 373–384, 2000. ;
and

[6150] Franco, M.; Boretto, J.; Robineau, S.; Monier, S.; Goud, B.; Chardin, P.; Chavrier, P. : ARNO3, a Sec7–domain guanine nucleotide exchange factor for ADP ribosylation factor 1, is invol.

[6151] Further studies establishing the function and utilities of PSCD4 are found in John Hopkins OMIM database record ID 606514, and in cited publications numbered 2451 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM205 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:1077, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6152] Another function of VGAM205 is therefore inhibition of

Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48.X Kell Blood Group Precursor-related, Y-linked (XKRY, Accession NM_004677) is another VGAM205 host target gene. XKRY BINDING SITE1 and XKRY BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by XKRY, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XKRY BINDING SITE1 and XKRY BINDING SITE2, designated SEQ ID:1142 and SEQ ID:2551 respectively, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6153] Another function of VGAM205 is therefore inhibition of X Kell Blood Group Precursor-related, Y-linked (XKRY, Accession NM_004677). Accordingly, utilities of VGAM205

include diagnosis, prevention and treatment of diseases and clinical conditions associated with XKRY. Chromosome 3 Open Reading Frame 4 (C3orf4, Accession NM_019895) is another VGAM205 host target gene. C3orf4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C3orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3orf4 BINDING SITE, designated SEQ ID:1890, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6154] Another function of VGAM205 is therefore inhibition of Chromosome 3 Open Reading Frame 4 (C3orf4, Accession NM_019895). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3orf4. FLJ10483 (Accession NM_018108) is another VGAM205 host target gene. FLJ10483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10483 BINDING SITE, designated SEQ ID:1781, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6155] Another function of VGAM205 is therefore inhibition of FLJ10483 (Accession NM_018108). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10483. FLJ12568 (Accession NM_024993) is another VGAM205 host target gene. FLJ12568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12568 BINDING SITE, designated SEQ ID:2122, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6156] Another function of VGAM205 is therefore inhibition of FLJ12568 (Accession NM_024993). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12568.

FLJ20340 (Accession NM_017773) is another VGAM205 host target gene. FLJ20340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20340 BINDING SITE, designated SEQ ID:1750, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6157] Another function of VGAM205 is therefore inhibition of FLJ20340 (Accession NM_017773). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20340. FLJ20727 (Accession NM_017944) is another VGAM205 host target gene. FLJ20727 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20727 BINDING SITE, designated SEQ ID:1769, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:540.

[6158] Another function of VGAM205 is therefore inhibition of FLJ20727 (Accession NM_017944). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20727. FLJ20736 (Accession NM_017948) is another VGAM205 host target gene. FLJ20736 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20736 BINDING SITE, designated SEQ ID:1770, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6159] Another function of VGAM205 is therefore inhibition of FLJ20736 (Accession NM_017948). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20736. Phosphodiesterase 1C, Calmodulin-dependent 70kDa (PDE1C, Accession NM_005020) is another VGAM205 host target gene. PDE1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by PDE1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE1C BINDING SITE, designated SEQ ID:1172, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6160] Another function of VGAM205 is therefore inhibition of Phosphodiesterase 1C, Calmodulin-dependent 70kDa (PDE1C, Accession NM_005020). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE1C. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM205 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:3680, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6161] Another function of VGAM205 is therefore inhibition of

Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. TSC22 (Accession NM_006022) is another VGAM205 host target gene. TSC22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSC22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSC22 BINDING SITE, designated SEQ ID:1264, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6162] Another function of VGAM205 is therefore inhibition of TSC22 (Accession NM_006022). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSC22. TSP-NY (Accession NM_032573) is another VGAM205 host target gene. TSP-NY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSP-NY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of TSP-NY BINDING SITE, designated SEQ ID:2262, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6163] Another function of VGAM205 is therefore inhibition of TSP-NY (Accession NM_032573). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSP-NY. TUCAN (Accession NM_014959) is another VGAM205 host target gene. TUCAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUCAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:1598, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6164] Another function of VGAM205 is therefore inhibition of TUCAN (Accession NM_014959). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUCAN. LOC138241 (Accession XM_059957) is another VGAM205

host target gene. LOC138241 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138241 BINDING SITE, designated SEQ ID:3019, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6165] Another function of VGAM205 is therefore inhibition of LOC138241 (Accession XM_059957). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138241. LOC152345 (Accession XM_087442) is another VGAM205 host target gene. LOC152345 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152345, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152345 BINDING SITE, designated SEQ ID:3170, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6166] Another function of VGAM205 is therefore inhibition of LOC152345 (Accession XM_087442). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152345. LOC154214 (Accession XM_087876) is another VGAM205 host target gene. LOC154214 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154214 BINDING SITE, designated SEQ ID:3189, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6167] Another function of VGAM205 is therefore inhibition of LOC154214 (Accession XM_087876). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154214. LOC154790 (Accession XM_088044) is another VGAM205 host target gene. LOC154790 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154790, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154790 BINDING SITE, designated SEQ ID:3192, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6168] Another function of VGAM205 is therefore inhibition of LOC154790 (Accession XM_088044). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154790. LOC158427 (Accession NM_139246) is another VGAM205 host target gene. LOC158427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158427 BINDING SITE, designated SEQ ID:2478, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6169] Another function of VGAM205 is therefore inhibition of LOC158427 (Accession NM_139246). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158427. LOC161003 (Accession NM_145286) is another VGAM205 host target gene. LOC161003 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161003 BINDING SITE, designated SEQ ID:2520, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6170] Another function of VGAM205 is therefore inhibition of LOC161003 (Accession NM_145286). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161003. LOC200830 (Accession XM_117287) is another VGAM205 host target gene. LOC200830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200830 BINDING SITE, designated SEQ ID:3480, to the nucleotide sequence of VGAM205 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:540.

[6171] Another function of VGAM205 is therefore inhibition of LOC200830 (Accession XM_117287). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200830. LOC221421 (Accession XM_166428) is another VGAM205 host target gene. LOC221421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221421 BINDING SITE, designated SEQ ID:3558, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6172] Another function of VGAM205 is therefore inhibition of LOC221421 (Accession XM_166428). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221421. LOC257017 (Accession XM_173227) is another VGAM205 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257017, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:3736, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6173] Another function of VGAM205 is therefore inhibition of LOC257017 (Accession XM_173227). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. LOC257353 (Accession XM_173264) is another VGAM205 host target gene. LOC257353 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257353 BINDING SITE, designated SEQ ID:3738, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6174] Another function of VGAM205 is therefore inhibition of LOC257353 (Accession XM_173264). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257353. LOC90459 (Accession XM_031826) is another VGAM205 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:2642, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:540.

[6175] Another function of VGAM205 is therefore inhibition of LOC90459 (Accession XM_031826). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 206 (VGAM206) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6176] VGAM206 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM206 was detected is described hereinabove with reference to Figs. 1–8.

[6177] VGAM206 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6178] VGAM206 gene encodes a VGAM206 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM206 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM206 precursor RNA is designated SEQ ID:192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:192 is located at position 109361 relative to the genome of Vaccinia Virus.

[6179] VGAM206 precursor RNA folds onto itself, forming VGAM206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6180] An enzyme complex designated DICER COMPLEX, `dices` the VGAM206 folded precursor RNA into VGAM206 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM206 RNA is designated SEQ ID:541, and is provided hereinbelow with reference to the sequence listing part.

[6181] VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM206 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6182] VGAM206 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM206 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM206 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6183] The complementary binding of VGAM206 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM206 host target RNA into VGAM206 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6184] It is appreciated that VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM206 host target genes. The mRNA of each one of this plurality of VGAM206 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM206 RNA, herein designated VGAM RNA, and which when bound by VGAM206 RNA causes inhibition of translation of respective one or more VGAM206 host target proteins.

[6185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM206 gene, herein designated VGAM GENE, on one or more VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6186] It is yet further appreciated that a function of VGAM206 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM206 correlate with, and may be deduced from, the identity of the host target genes which VGAM206 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6187] Nucleotide sequences of the VGAM206 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM206 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM206 are further described hereinbelow with reference to Table 1.

[6188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM206 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM206 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6189] As mentioned hereinabove with reference to Fig. 1, a function of VGAM206 gene, herein designated VGAM is inhibition of expression of VGAM206 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM206 correlate with, and may be deduced from, the identity of the target genes which VGAM206 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6190] Coxsackie Virus and Adenovirus Receptor (CXADR, Accession NM_001338) is a VGAM206 host target gene. CXADR BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by CXADR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXADR BINDING SITE, designated SEQ ID:820, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6191] A function of VGAM206 is therefore inhibition of Coxsackie Virus and Adenovirus Receptor (CXADR, Accession NM_001338), a gene which is a member of the immunoglobulin superfamily. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXADR. The function of CXADR has been established by previous studies. Bergelson et al. (1997) used immunoaffinity chromatography to purify a Cocksackie virus and adenovirus receptor protein, which they termed CAR. Based on the sequences of tryptic peptides, they cloned the corresponding cDNA from a HeLa cell library. The CAR cDNA encodes a predicted 365-amino acid polypeptide that contains a single transmembrane domain and is a member of the immunoglobulin superfamily. Bergelson et al. (1997) found that Chinese hamster cells bound to labeled

Coxsackie viruses B3 and B4 and became susceptible to infection when transfected with CAR cDNA. Myocarditis and dilated cardiomyopathy are common causes of morbidity and mortality in children. Many studies have implicated the enteroviruses and particularly the Coxsackie virus B family as etiologic agents of the acquired forms of these diseases. However, Martin et al. (1994), Griffin et al. (1995), and Pauschinger et al. (1999) showed that the group C adenoviruses are as commonly detected as enteroviruses in the myocardium of children and adults with these diseases. The description of the common Coxsackie virus B and adenovirus receptor offers a partial explanation for the observation that 2 such divergent virus families cause these diseases.

[6192] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6193] Bergelson, J. M.; Cunningham, J. A.; Droguett, G.; Kurt-Jones, E. A.; Krithivas, A.; Hong, J. S.; Horwitz, M. S.; Crowell, R. L.; Finberg, R. W. : Isolation of a common receptor for coxsackie B viruses and adenoviruses 2 and 5. Science 275: 1320–1323, 1997. ; and

Pham, V.; Kuhl, U.; Schwimbeck, P. L.; Schultheiss, H.-P.; Towbin, J. A. : Detection of adenoviral genome in the myocardium of adu.

[6195] Further studies establishing the function and utilities of CXADR are found in John Hopkins OMIM database record ID 602621, and in cited publications numbered 1929–1935 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EPB72 (Accession NM_004099) is another VGAM206 host target gene. EPB72 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:1087, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6196] Another function of VGAM206 is therefore inhibition of EPB72 (Accession NM_004099), a gene which may regulate cation conductance. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB72. The function of

EPB72 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM205.Fc Fragment of IgA, Receptor For (FCAR, Accession NM_002000) is another VGAM206 host target gene. FCAR BINDING SITE1 through FCAR BINDING SITE7 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FCAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 through FCAR BINDING SITE7, designated SEQ ID:880, SEQ ID:2400, SEQ ID:2401, SEQ ID:2402, SEQ ID:2403, SEQ ID:2404 and SEQ ID:2406 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6197] Another function of VGAM206 is therefore inhibition of Fc Fragment of IgA, Receptor For (FCAR, Accession NM_002000), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCAR. The

function of FCAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM170. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071) is another VGAM206 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:1468, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6198] Another function of VGAM206 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 has been established by previous studies. Using the ligand-binding domain of the retinoid X receptor as bait in a yeast

2-hybrid screen to identify potential transcriptional coactivators of nuclear receptors, Lee et al. (1999) isolated a cDNA encoding a nuclear protein-activating signal cointegrator, which they designated ASC2. Sequence analysis of the 2,063 amino acid protein predicted an N-terminal acidic domain, 2 glutamine-rich domains, and a C-terminal serine/threonine-rich domain as well as 2 separate basic potential nuclear localization signal domains and 2 copies of LXXLL motifs that function in ligand-dependent interaction with the AF2 domain of nuclear receptors. Analyzing tissue microarrays by FISH, Lee et al. (1999) found increased ASC2 copy number in 10% of breast cancer specimens and in all breast cancer cell lines. SDS-PAGE analysis showed that amino acids 586–860, which do not include the LXXLL motifs, are the minimum interaction domain with the AF2 domain of numerous nuclear receptors. N-terminal subregions of ASC2, either alone or in conjunction with CBP (OMIM Ref. No. 600140) and SRC1 (NCOA1; 602691), stimulate ligand-dependent transactivation by wildtype nuclear receptors. Microinjection of anti-ASC2 into cells demonstrated abrogation of the transactivation function. Caira et al. (2000) and Mahajan and Samuels (2000) isolated cDNAs encoding a protein

identical to ASC2, which they termed nuclear receptor-activating protein 250 kD (OMIM Ref. No. RAP250) and nuclear receptor coregulator (NRC), respectively. Northern blot analysis revealed widespread expression of an approximately 7.5-kb transcript, with a 4.5-kb splice variant detected in testis. Analysis of the testis sequence indicated that it encodes a 1,070 amino acid protein that lacks residues 972–1964 of the full-length sequence (Caira et al., 2000). ASC2 was also found to be widely expressed during ontogeny in rat embryos. Using GST pull-down assays, Caira et al. (2000) determined that the first LXXLL motif (LVNLL, contained in residues 819–1096) but not the second (LSQLL, residues 1491–1495) interacted strongly with nuclear receptors. Mahajan and Samuels (2000) also found that only the first LXXLL domain is functional and that mutation of this sequence abolished transcriptional enhancement.

[6199] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6202] Further studies establishing the function and utilities of NCOA6 are found in John Hopkins OMIM database record ID 605299, and in cited publications numbered 1678-168 and 2639 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Succinate Dehydrogenase Complex, Subunit C, Integral Membrane Protein, 15kDa (SDHC, Accession XM_045183) is another VGAM206 host target gene. SDHC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDHC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDHC BINDING SITE, designated SEQ ID:2856, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:541.

[6203] Another function of VGAM206 is therefore inhibition of Succinate Dehydrogenase Complex, Subunit C, Integral Membrane Protein, 15kDa (SDHC, Accession XM_045183). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDHC. Cerebellin 1 Precursor (CBLN1, Accession NM_004352) is another VGAM206 host target gene. CBLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLN1 BINDING SITE, designated SEQ ID:1101, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6204] Another function of VGAM206 is therefore inhibition of Cerebellin 1 Precursor (CBLN1, Accession NM_004352). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLN1. Cleavage Stimulation Factor, 3' Pre-RNA, Subunit 2, 64kDa (CSTF2, Accession

NM_001325) is another VGAM206 host target gene. CSTF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSTF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSTF2 BINDING SITE, designated SEQ ID:819, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6205] Another function of VGAM206 is therefore inhibition of Cleavage Stimulation Factor, 3' Pre-RNA, Subunit 2, 64kDa (CSTF2, Accession NM_001325). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSTF2. GS3955 (Accession NM_021643) is another VGAM206 host target gene. GS3955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GS3955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GS3955 BINDING SITE, designated SEQ ID:1953, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:541.

[6206] Another function of VGAM206 is therefore inhibition of GS3955 (Accession NM_021643). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GS3955. KIAA0184 (Accession XM_036865) is another VGAM206 host target gene. KIAA0184 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0184 BINDING SITE, designated SEQ ID:2715, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6207] Another function of VGAM206 is therefore inhibition of KIAA0184 (Accession XM_036865). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0184. MGC14697 (Accession NM_032747) is another VGAM206 host target gene. MGC14697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC14697, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14697 BINDING SITE, designated SEQ ID:2276, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6208] Another function of VGAM206 is therefore inhibition of MGC14697 (Accession NM_032747). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14697. RRN3 (Accession NM_018427) is another VGAM206 host target gene. RRN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRN3 BINDING SITE, designated SEQ ID:1827, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6209] Another function of VGAM206 is therefore inhibition of RRN3 (Accession NM_018427). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with RRN3. WD Repeat Domain 13 (WDR13, Accession NM_017883) is another VGAM206 host target gene. WDR13 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WDR13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR13 BINDING SITE, designated SEQ ID:1759, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6210] Another function of VGAM206 is therefore inhibition of WD Repeat Domain 13 (WDR13, Accession NM_017883). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR13. LOC219287 (Accession XM_167994) is another VGAM206 host target gene. LOC219287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219287 BINDING SITE, desig-

nated SEQ ID:3609, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6211] Another function of VGAM206 is therefore inhibition of LOC219287 (Accession XM_167994). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219287. LOC221979 (Accession XM_166540) is another VGAM206 host target gene. LOC221979 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221979 BINDING SITE, designated SEQ ID:3571, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6212] Another function of VGAM206 is therefore inhibition of LOC221979 (Accession XM_166540). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221979. LOC255328 (Accession XM_172920) is another VGAM206 host target gene. LOC255328 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255328 BINDING SITE, designated SEQ ID:3710, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6213] Another function of VGAM206 is therefore inhibition of LOC255328 (Accession XM_172920). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255328. LOC257115 (Accession XM_172898) is another VGAM206 host target gene. LOC257115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257115 BINDING SITE, designated SEQ ID:3709, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6214] Another function of VGAM206 is therefore inhibition of

LOC257115 (Accession XM_172898). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257115. LOC51145 (Accession NM_016158) is another VGAM206 host target gene. LOC51145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51145 BINDING SITE, designated SEQ ID:1666, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:541.

[6215] Another function of VGAM206 is therefore inhibition of LOC51145 (Accession NM_016158). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 207 (VGAM207) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[6216] VGAM207 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM207 was detected is described hereinabove with reference to Figs. 1–8.

[6217] VGAM207 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM207 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6218] VGAM207 gene encodes a VGAM207 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM207 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM207 precursor RNA is designated SEQ ID:193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:193 is located at position 109549 relative to the genome of Vaccinia Virus.

[6219] VGAM207 precursor RNA folds onto itself, forming VGAM207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[6220] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM207 folded precursor RNA into VGAM207 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 80%) nucleotide se-
quence of VGAM207 RNA is designated SEQ ID:542, and is
provided hereinbelow with reference to the sequence list-
ing part.

[6221] VGAM207 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM207 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM207 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6222] VGAM207 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM207 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM207 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM207 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM207 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[6223] The complementary binding of VGAM207 RNA, herein designated VGAM RNA, to host target binding sites on VGAM207 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM207 host target RNA into VGAM207 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6224] It is appreciated that VGAM207 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM207 host target genes. The mRNA of each one of this plurality of VGAM207 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM207 RNA, herein designated VGAM RNA, and which when bound by VGAM207 RNA causes inhibition of translation of respective one or more VGAM207 host target proteins.

[6225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM207 gene, herein designated VGAM GENE, on one or

more VGAM207 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6226] It is yet further appreciated that a function of VGAM207 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM207 correlate with, and may be deduced from, the identity of the host target genes which VGAM207 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [6227] Nucleotide sequences of the VGAM207 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM207 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM207 are further described hereinbelow with reference to Table 1.
- [6228] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM207 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM207 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [6229] As mentioned hereinabove with reference to Fig. 1, a function of VGAM207 gene, herein designated VGAM is inhibition of expression of VGAM207 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM207 correlate with, and may be deduced from, the identity of the target genes which VGAM207 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [6230] B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A,

Accession NM_022893) is a VGAM207 host target gene. BCL11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11A BINDING SITE, designated SEQ ID:2018, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6231] A function of VGAM207 is therefore inhibition of B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A, Accession NM_022893), a gene which acts as a transcriptional repressor. Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11A. The function of BCL11A has been established by previous studies. By screening a fetal brain cDNA library with mouse Evi9 as probe, Saiki et al. (2000) isolated a cDNA encoding EVI9, also termed BCL11A, and a shorter splice variant, EVI9C. Sequence analysis predicted that the 797-amino acid BCL11A protein, which is 99% identical to the mouse protein apart from an additional 35 N-terminal residues,

contains 3 C2H2-type zinc finger motifs, a proline-rich region, and an acidic domain. Northern blot analysis revealed highest expression in brain, spleen, and testis. RT-PCR analysis detected expression in most hematopoietic cells but downregulation during monocytic differentiation. Satterwhite et al. (2001) reported the recurrent involvement and deregulated expression of BCL11A in 4 cases of B-cell malignancy with the translocation t(2;14)(p13;q32.3). They noted that this translocation is a rare cytogenetic abnormality in the clinically aggressive subset of B-cell chronic lymphocytic leukemia (OMIM Ref. No. 151400)/immunocytoma. FISH analysis showed colocalization of BCL11A and REL (OMIM Ref. No. 164910) in B-cell non-Hodgkin lymphoma (OMIM Ref. No. 605027). Satterwhite et al. (2001) also identified a BCL11A homolog, BCL11B (OMIM Ref. No. 606558). Comparative genomic hybridization studies showed gains in chromosome region 2p as the most common imbalance in classical Hodgkin lymphoma. The minimal region of gain contained 2 candidate oncogenes, REL and BCL11A. Martin-Subero et al. (2002) examined the involvement of REL and BCL11A loci in 44 primary cases of classic Hodgkin lymphoma by combined immunophenotyping and interphase

cytogenetics. A median 2p13 copy number above the tetraploid range was detected in 24 (55%) cases. One case displayed selective amplification of the REL locus not affecting BCL11A. Two other cases showed evidence of breakpoints in the region spanned by the REL probe. These data indicated that REL rather than BCL11A may be the target of the 2p13 alterations in classic Hodgkin lymphoma.

[6232] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6233] Satterwhite, E.; Sonoki, T.; Willis, T. G.; Harder, L.; Nowak, R.; Arriola, E. L.; Liu, H.; Price, H. P.; Gesk, S.; Steinemann, D.; Schlegelberger, B.; Oscier, D. G.; Siebert, R.; Tucker, P. W.; Dyer, M. J. S. : The BCL11 gene family: involvement of BCL11A in lymphoid malignancies. Blood 98: 3413–3420, 2001. ; and

[6234] Martin-Subero, J. I.; Gesk, S.; Harder, L.; Sonoki, T.; Tucker, P. W.; Schlegelberger, B.; Grote, W.; Novo, F. J.; Calasanz, M. J.; Hansmann, M. L.; Dyer, M. J. S.; Siebert, R. : Recurr.

[6235] Further studies establishing the function and utilities of BCL11A are found in John Hopkins OMIM database record

ID 606557, and in cited publications numbered 2687–1277 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM_004337) is another VGAM207 host target gene. C8orf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C8orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf1 BINDING SITE, designated SEQ ID:1099, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6236] Another function of VGAM207 is therefore inhibition of Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM_004337). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf1. Karyopherin Alpha 1 (importin alpha 5) (KPNA1, Accession XM_087256) is another VGAM207 host target gene. KPNA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KPNA1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA1 BINDING SITE, designated SEQ ID:3159, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6237] Another function of VGAM207 is therefore inhibition of Karyopherin Alpha 1 (importin alpha 5) (KPNA1, Accession XM_087256), a gene which promotes docking of import substrates to the nuclear pore complex. Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA1. The function of KPNA1 has been established by previous studies. Cortes et al. (1994) used the 2-hybrid protein interaction systems to isolate a protein that specifically interacts with RAG1 (OMIM Ref. No. 179615). The genes RAG1 and RAG2 (OMIM Ref. No. 179616) are able to activate V(D)J recombination when transfected into fibroblasts. Further, knockout mice for these 2 loci lack B and T cells. Several other ubiquitously expressed proteins are thought to be recruited in the recombination process. Among these are the genes affected in severe combined immune deficiency (e.g., OMIM Ref. No. also 600899) and

genes involved in ds-DNA break repair. The human cDNA identified by Cortes et al. (1994) encodes a 489-amino acid polypeptide that shows striking similarity to the yeast SRP1 protein, a mutant allele which can suppress a mutation of RNA polymerase I. The authors obtained human and mouse cDNA sequences which are 98% identical as proteins. When RAG1 and human SRP1 were cotransfected into 293T cells a stable complex of the 2 was observed. The authors speculated that because SRP1 appears to be bound to the nuclear envelope, the interaction with RAG1 may serve to localize that protein to the envelope as well. Conti et al. (1998) reported the crystal structure of a 50-kD fragment of the 60-kD yeast karyopherin alpha, in the absence and presence of a monopartite nuclear localization signal (NLS) peptide at 2.2-angstrom and 2.8-angstrom resolution, respectively. The structure showed a tandem array of 10 armadillo repeats, organized in a right-handed superhelix of helices. Binding of the NLS peptide occurred at 2 sites within a helical surface groove. The structure reveals the determinants of NLS specificity and suggested a model for the recognition of bipartite NLSs. By fluorescence in situ hybridization, Ayala-Madrigal et al. (2000) mapped the human KPNA1 gene to

chromosome 3q21.

[6238] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6239] Ayala-Madrigal, M. L.; Doerr, S.; Ramirez-Duenas, M. L.; Hansmann, I. : Assignment of karyopherin alpha 1 (KPNA1) to human chromosome band 3q21 by in situ hybridization. Cytogenet. Cell Genet. 90: 58-59, 2000. ; and

[6240] Conti, E.; Uy, M.; Leighton, L.; Blobel, G.; Kuriyan, J. : Crystallographic analysis of the recognition of a nuclear localization signal by the nuclear import factor karyopherin alpha.

[6241] Further studies establishing the function and utilities of KPNA1 are found in John Hopkins OMIM database record ID 600686, and in cited publications numbered 2247-2249 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurexin 1 (NRXN1, Accession NM_138735) is another VGAM207 host target gene. NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2, designated SEQ ID:2457 and SEQ ID:1158 respectively, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6242] Another function of VGAM207 is therefore inhibition of Neurexin 1 (NRXN1, Accession NM_138735), a gene which may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1. The function of NRXN1 has been established by previous studies. Neurexins are polymorphic cell surface proteins that are expressed in neurons. They were discovered by Ushkaryov et al. (1992) in the course of cloning the presynaptic receptor for alpha-latrotoxin. Three neurexin genes, designated 1 (NRXN1), 2 (NRXN2; 600566), and 3 (NRXN3; 600567), were identified in a rat brain cDNA library by Ushkaryov et al. (1992). Ichtchenko et al. (1995) observed that each neurexin gene has 2 independent promoters which generate 2 classes of mRNAs: the longer mRNAs encode alpha-neurexins and the shorter mRNAs encode beta-neurexins. Thus, 6 principal neurexin iso-

forms, called neurexins I-alpha to III-beta, result, of which neurexin I-alpha corresponds to the high molecular weight component of the alpha-latrotoxin receptor.

Ushkaryov et al. (1992) showed that rat neurexins are expressed at significant levels only in brain. Ullrich et al. (1995) found that the 6 rat neurexin isoforms are coexpressed in neurons and are distributed differentially in various brain regions. Neurexins display a remarkable evolutionarily conserved pattern of extensive alternative splicing. As a result, the total number of neurexins in brain probably exceeds 2,000 (Ullrich et al., 1995).

Neurexins contain epidermal growth factor-like sequences and domains homologous to the G domain repeats of laminin A (LAMA; 150320), indicating a function in cell-cell interactions. Animal model experiments lend further support to the function of NRXN1. Alpha-latrotoxin is a potent neurotoxin from black widow spider venom that binds to presynaptic receptors and causes massive neurotransmitter release. In rat, 2 alpha-latrotoxin receptors have been identified: neurexin I-alpha, which binds the toxin in a calcium-dependent manner, and CIRL/latrophilin, which binds in a calcium-independent manner. Geppert et al. (1998) isolated the mouse neurexin I-alpha

gene and found that it contains a large first exon of more than 1.5 kb that extends to the first site of alternative splicing in the coding region. To evaluate the importance of neurexin I- α in α -latrotoxin action, Geppert et al. (1998) generated mice carrying a deletion of the first exon of the neurexin I- α gene. Homozygous mutant mice lacked neurexin I- α , although the levels of neurexin I- β were unaffected. The mutant mice were viable and fertile, and were indistinguishable in appearance from wildtype animals. The only abnormality observed was that female knockout mice were less able to attend to litters, leading to the death of more pups independent of pup genotype. Geppert et al. (1998) found that α -latrotoxin binding to brain membranes from mutant mice was decreased by almost 50% compared with wildtype membranes. In cultured hippocampal neurons from mutant mice, the toxin was still capable of activating neurotransmission. However, measurements of glutamate release from synaptosomes indicated a major decrease in the amount of release triggered by α -latrotoxin in the presence of calcium. The authors concluded that neurexin I- α is not essential for α -latrotoxin action but contributes to toxin action when calcium is present. They

suggested that the action of alpha-latrotoxin may be mediated by independent parallel pathways.

[6243] It is appreciated that the abovementioned animal model for NRXN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6244] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6246] Ushkaryov, Y. A.; Petrenko, A. G.; Geppert, M.; Sudhof, T. C. : Neurexins: synaptic cell surface proteins related to the alpha-latrotoxin receptor and laminin. Science 257: 50-56, 199.

[6247] Further studies establishing the function and utilities of NRXN1 are found in John Hopkins OMIM database record ID 600565, and in cited publications numbered 1859-1863, 156 and 2146-2149 listed in the bibliography section hereinbelow, which are also hereby incorpo-

rated by reference. Sorting Nexin 5 (SNX5, Accession NM_014426) is another VGAM207 host target gene. SNX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX5 BINDING SITE, designated SEQ ID:1500, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6248] Another function of VGAM207 is therefore inhibition of Sorting Nexin 5 (SNX5, Accession NM_014426). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX5. BCL2/adenovirus E1B 19kDa Interacting Protein 2 (BNIP2, Accession XM_039703) is another VGAM207 host target gene. BNIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNIP2 BINDING SITE, designated SEQ ID:2762, to the nucleotide sequence of

VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6249] Another function of VGAM207 is therefore inhibition of BCL2/adenovirus E1B 19kDa Interacting Protein 2 (BNIP2, Accession XM_039703). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP2. DRIL2 (Accession NM_006465) is another VGAM207 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:1305, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6250] Another function of VGAM207 is therefore inhibition of DRIL2 (Accession NM_006465). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. DVS27 (Accession NM_033439) is another VGAM207 host target gene. DVS27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by DVS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVS27 BINDING SITE, designated SEQ ID:2335, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6251] Another function of VGAM207 is therefore inhibition of DVS27 (Accession NM_033439). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVS27. FLJ12960 (Accession NM_024638) is another VGAM207 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:2074, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6252] Another function of VGAM207 is therefore inhibition of FLJ12960 (Accession NM_024638). Accordingly, utilities of

VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960. FLJ20793 (Accession XM_166296) is another VGAM207 host target gene. FLJ20793 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20793 BINDING SITE, designated SEQ ID:3542, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6253] Another function of VGAM207 is therefore inhibition of FLJ20793 (Accession XM_166296). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20793. KIAA0040 (Accession NM_014656) is another VGAM207 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE,

designated SEQ ID:1515, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6254] Another function of VGAM207 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. KIAA1349 (Accession XM_047617) is another VGAM207 host target gene. KIAA1349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1349 BINDING SITE, designated SEQ ID:2893, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6255] Another function of VGAM207 is therefore inhibition of KIAA1349 (Accession XM_047617). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1349. KIAA1373 (Accession XM_048195) is another VGAM207 host target gene. KIAA1373 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:2903, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6256] Another function of VGAM207 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. SCDGF-B (Accession NM_025208) is another VGAM207 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:2147 and SEQ ID:2314 respectively, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ

ID:542.

[6257] Another function of VGAM207 is therefore inhibition of SCDGF-B (Accession NM_025208). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCDGF-B. LOC157729 (Accession XM_088374) is another VGAM207 host target gene. LOC157729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157729 BINDING SITE, designated SEQ ID:3205, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6258] Another function of VGAM207 is therefore inhibition of LOC157729 (Accession XM_088374). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157729. LOC200339 (Accession XM_117226) is another VGAM207 host target gene. LOC200339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200339, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:3475, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6259] Another function of VGAM207 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. LOC221300 (Accession XM_166322) is another VGAM207 host target gene. LOC221300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221300 BINDING SITE, designated SEQ ID:3545, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6260] Another function of VGAM207 is therefore inhibition of LOC221300 (Accession XM_166322). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC221300. LOC257235 (Accession XM_173124) is another VGAM207 host target gene. LOC257235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257235 BINDING SITE, designated SEQ ID:3728, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6261] Another function of VGAM207 is therefore inhibition of LOC257235 (Accession XM_173124). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257235. LOC93333 (Accession XM_050624) is another VGAM207 host target gene. LOC93333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93333 BINDING SITE, designated SEQ ID:2932, to the

nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:542.

[6262] Another function of VGAM207 is therefore inhibition of LOC93333 (Accession XM_050624). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 208 (VGAM208) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6263] VGAM208 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM208 was detected is described hereinabove with reference to Figs. 1–8.

[6264] VGAM208 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6265] VGAM208 gene encodes a VGAM208 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM208 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM208 precursor RNA is designated SEQ ID:194, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:194 is located at position 109656 relative to the genome of Vaccinia Virus.

[6266] VGAM208 precursor RNA folds onto itself, forming VGAM208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6267] An enzyme complex designated DICER COMPLEX, `dices` the VGAM208 folded precursor RNA into VGAM208 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM208 RNA is designated SEQ ID:543, and is provided hereinbelow with reference to the sequence listing part.

[6268] VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM208 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6269] VGAM208 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM208 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM208 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6270] The complementary binding of VGAM208 RNA, herein designated VGAM RNA, to host target binding sites on VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM208 host target RNA into VGAM208 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6271] It is appreciated that VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM208 host target genes. The mRNA of each one of this plurality of VGAM208 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM208 RNA, herein designated VGAM RNA, and which when bound by VGAM208 RNA causes inhibition of translation of respective one or more VGAM208 host target proteins.

[6272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM208 gene, herein designated VGAM GENE, on one or more VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[6273] It is yet further appreciated that a function of VGAM208 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM208 correlate with, and may be deduced from, the identity of the host target genes which VGAM208 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[6274] Nucleotide sequences of the VGAM208 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM208 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM208 are further described hereinbelow with reference to Table 1.

[6275] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM208 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM208 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6276] As mentioned hereinabove with reference to Fig. 1, a function of VGAM208 gene, herein designated VGAM is inhibition of expression of VGAM208 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM208 correlate with, and may be deduced from, the identity of the target genes which VGAM208 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6277] BH-protocadherin (brain-heart) (PCDH7, Accession NM_002589) is a VGAM208 host target gene. PCDH7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH7 BINDING SITE, designated SEQ ID:938, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:543.

[6278] A function of VGAM208 is therefore inhibition of BH-protocadherin (brain-heart) (PCDH7, Accession

NM_002589). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH7. TRC8 (Accession NM_007218) is another VGAM208 host target gene. TRC8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRC8 BINDING SITE, designated SEQ ID:1365, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:543.

[6279] Another function of VGAM208 is therefore inhibition of TRC8 (Accession NM_007218), a gene which Multiple membrane spanning protein; may be a signalling receptor and is presumed role as a tumor suppressor gene. Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRC8. The function of TRC8 has been established by previous studies. Cohen et al. (1979) described a family in which a 3;8 chromosomal translocation, t(3;8)(p14.2;q24.1), was associated with classic features of hereditary renal cell carcinoma (OMIM Ref. No.

144700), i.e., autosomal dominant inheritance, early onset, and bilateral disease. Follow-up analysis found the occurrence of thyroid cancer in 2 translocation carriers with RCC (Li et al., 1993). Although studies demonstrated that the 3p14.2 breakpoint interrupted the fragile histidine triad gene (FHIT; 601153) in its 5-prime noncoding region (Ohta et al., 1996), several reasons made it unlikely that FHIT is causally related to renal or other malignancies. Gemmill et al. (1998) showed that the 8q24.1 breakpoint region encodes a 664-amino acid multiple membrane-spanning protein, which they called TRC8, for 'translocation in renal carcinoma, chromosome 8 gene.' The gene showed similarity to the hereditary basal cell carcinoma/segment polarity gene, 'patched.' This similarity involved 2 regions of 'patched,' the putative sterol-sensing domain and the second extracellular loop that participates in the binding of sonic hedgehog (SHH; 600725). In the 3;8 translocation, TRC8 was found to be fused to FHIT and disrupted within the sterol-sensing domain. In contrast, the FHIT coding region was maintained and expressed. In a series of sporadic renal carcinomas, an acquired TRC8 mutation was identified. By analogy to patched, TRC8 might function as a signaling receptor, and

other pathway members, to be defined, are mutation candidates in malignant diseases involving the kidney and thyroid. Gemmill et al. (2002) isolated the *Drosophila* homolog of TRC8 and studied its function by genetic manipulations and a yeast 2-hybrid screen. Human and *Drosophila* TRC8 proteins localize to the endoplasmic reticulum. Loss of either *Drosophila* Trc8 or Vhl resulted in an identical ventral midline defect. Direct interaction between Trc8 and Vhl in *drosophila* was confirmed by GST-pulldown and coimmunoprecipitation experiments. Gemmill et al. (2002) found that in *Drosophila*, overexpression of Trc8 inhibited growth consistent with its presumed role as a tumor suppressor gene. Human JAB1 (OMIM Ref. No. 604850) localization was dependent on VHL mutant status. Thus, the VHL, TRC8, and JAB1 proteins appear to be linked both physically and functionally, and all 3 may participate in the development of kidney cancer

[6280] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6281] Gemmill, R. M.; Bemis, L. T.; Lee, J. P.; Sozen, M. A.; Baron, A.; Zeng, C.; Erickson, P. F.; Hooper, J. E.; Drabkin, H. A. :

The TRC8 hereditary kidney cancer gene suppresses growth and functions with VHL in a common pathway.

Oncogene 21: 3507–3516, 2002. ; and

[6282] Gemmill, R. M.; West, J. D.; Boldog, F.; Tanaka, N.; Robinson, L. J.; Smith, D. I.; Li, F.; Drabkin, H. A. : The hereditary renal cell carcinoma 3;8 translocation fuses FHIT to a patch.

[6283] Further studies establishing the function and utilities of TRC8 are found in John Hopkins OMIM database record ID 603046, and in cited publications numbered 301 and 3015–605 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC145225 (Accession XM_096741) is another VGAM208 host target gene. LOC145225 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145225 BINDING SITE, designated SEQ ID:3275, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:543.

[6284] Another function of VGAM208 is therefore inhibition of

LOC145225 (Accession XM_096741). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145225. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 209 (VGAM209) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6285] VGAM209 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM209 was detected is described hereinabove with reference to Figs. 1–8.

[6286] VGAM209 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6287] VGAM209 gene encodes a VGAM209 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM209 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM209 precursor RNA is designated SEQ ID:195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:195 is located at position 109286 relative to the genome of Vaccinia Virus.

[6288] VGAM209 precursor RNA folds onto itself, forming VGAM209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6289] An enzyme complex designated DICER COMPLEX, `dices` the VGAM209 folded precursor RNA into VGAM209 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide se-

quence of VGAM209 RNA is designated SEQ ID:544, and is provided hereinbelow with reference to the sequence listing part.

[6290] VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM209 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[6291] VGAM209 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM209 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM209 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[6292] The complementary binding of VGAM209 RNA, herein designated VGAM RNA, to host target binding sites on VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM209 host target RNA into VGAM209 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6293] It is appreciated that VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM209 host target genes. The mRNA of each one of this plurality of VGAM209 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM209 RNA, herein designated VGAM RNA, and which when bound by VGAM209 RNA causes inhibition of translation of respective one or more VGAM209 host target proteins.

[6294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM209 gene, herein designated VGAM GENE, on one or more VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6295] It is yet further appreciated that a function of VGAM209 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM209 correlate with, and may be deduced from, the identity of the host target genes which VGAM209 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6296] Nucleotide sequences of the VGAM209 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM209 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM209 are further described hereinbelow with reference to Table 1.

[6297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM209 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM209 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6298] As mentioned hereinabove with reference to Fig. 1, a function of VGAM209 gene, herein designated VGAM is inhibition of expression of VGAM209 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM209 correlate with, and may be deduced from, the identity of the target genes which VGAM209 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6299] Betaine-homocysteine Methyltransferase 2 (BHMT2, Accession NM_017614) is a VGAM209 host target gene. BHMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHMT2 BINDING SITE, designated SEQ ID:1729, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6300] A function of VGAM209 is therefore inhibition of Betaine-homocysteine Methyltransferase 2 (BHMT2, Accession NM_017614). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with BHMT2. Calnexin (CANX, Accession XM_113469) is another VGAM209 host target gene. CANX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CANX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CANX BINDING SITE, designated SEQ ID:3409, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6301] Another function of VGAM209 is therefore inhibition of Calnexin (CANX, Accession XM_113469), a gene which may function as a chaperone in the endoplasmic reticulum, involved in the secretion of proteins from the ER to the outer cellular membrane. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CANX. The function of CANX has been established by previous studies. Calnexin is a 90-kilodalton integral membrane protein of the endoplasmic reticulum (ER). It exhibits high affinity for the binding of calcium ions, which was the means by which it was first identified. Calcium ions are known to play a central role in the regulation of cellular

metabolism, including signal transduction events and the transport of proteins through the ER. Calnexin has been shown to be associated with several cell surface proteins during translocation through the ER and has been isolated as a complex with other ER proteins involved in calcium ion-dependent retention of proteins. It may function as a chaperone to regulate the transit of proteins through the ER. Tjoelker et al. (1994) isolated cDNA clones of the human, mouse, and rat calnexins. Comparisons of the sequences demonstrated a high level of conservation of sequence identity, suggesting that calnexin performs important cellular functions. Schwann cell-derived peripheral myelin protein-22 (PMP22; 601097), when mutated or overexpressed, causes heritable neuropathies with a 'gain-of-function' endoplasmic reticulum (ER) phenotype.

PMP22 associates in a specific and transient manner with CANX in wildtype sciatic nerves. In the sciatic nerves of the Trembler (TrJ) mouse carrying the same mutation in the PMP22 gene that causes Charcot-Marie-Tooth disease (CMT) in the human, Dickson et al. (2002) found prolonged association of mutant PMP22 with CANX. In cultured cells expressing the TrJ mutant PMP22, CANX and PMP22 colocalized in large intracellular structures identi-

fied at the electron microscopy level as myelin-like figures, with CANX localization in the structures dependent on PMP22 glucosylation. Similar intracellular myelin-like figures were also present in Schwann cells of sciatic nerves from homozygous Trj mice. Sequestration of CANX in intracellular myelin-like figures may be relevant to the pathogenesis of autosomal dominant CMT-related neuropathies.

[6302] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

W. : Human, mouse, and rat calnexin cDNA cloning: identification of potential calcium binding motifs and gene localization to human chromosome 5. *Biochemistry* 33: 3229–3236, 1994. ; and

[6304] Dickson, K. M.; Bergeron, J. J. M.; Shames, I.; Colby, J.; Nguyen, D. T.; Chevet, E.; Thomas, D. Y.; Snipes, G. J. : Association of calnexin with mutant peripheral myelin protein-22 ex v.

[6305] Further studies establishing the function and utilities of CANX are found in John Hopkins OMIM database record ID

114217, and in cited publications numbered 899–902 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coatomer Protein Complex, Subunit Gamma 2 (COPG2, Accession XM_088102) is another VGAM209 host target gene. COPG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COPG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPG2 BINDING SITE, designated SEQ ID:3194, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6306] Another function of VGAM209 is therefore inhibition of Coatomer Protein Complex, Subunit Gamma 2 (COPG2, Accession XM_088102), a gene which mediates biosynthetic protein transport from the er, via the golgi up to the trans golgi network. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPG2. The function of COPG2 has been established by previous studies. Blagitko et al. (1999) sought to determine whether 7q32 harbors

imprinted genes in addition to MEST (OMIM Ref. No. 601029), which is expressed in the paternal allele. They identified COPG2, a novel imprinted gene that overlaps with MEST and is transcribed from the paternally inherited allele in most fetal tissues, providing clear evidence that imprinting in 7q32 is regional. Expression was biallelic in fetal brain and liver and in adult peripheral blood. Biallelic expression in blood was supported by the demonstration of COPG2 transcripts in lymphoblastoid cell lines with maternal uniparental disomy 7. Absence of paternal COPG2 transcripts during embryonic development was thought to possibly contribute to Silver–Russell syndrome (OMIM Ref. No. 180860), which is associated with maternal uniparental disomy. However, mutation analysis in 42 patients with Silver–Russell syndrome and in 9 patients with primordial growth retardation detected only 1 maternally derived mutation in the COPG2 gene. In an effort to understand how CDC42 (OMIM Ref. No. 116952) mediates cellular transformation, Wu et al. (2000) searched for new CDC42 targets. They identified COPG2 as a specific binding partner for activated CDC42. The binding of CDC42 to COPG2 is essential for a transforming signal distinct from those elicited by Ras (see 190020

- [6307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [6310] Further studies establishing the function and utilities of COPG2 are found in John Hopkins OMIM database record ID 604355, and in cited publications numbered 120 and 2811 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139) is another VGAM209 host target gene. MS4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MS4A1 BINDING SITE, designated SEQ ID:711, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6311] Another function of VGAM209 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139), a gene which may be involved in the regulation of b-cell activation and proliferation. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A1. The function of MS4A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM_005065) is another VGAM209 host target gene. SEL1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEL1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEL1L BINDING SITE, designated SEQ ID:1180, to the nucleotide sequence of VGAM209 RNA, herein designated

VGAM RNA, also designated SEQ ID:544.

[6312] Another function of VGAM209 is therefore inhibition of Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM_005065), a gene which may play a role in notch signaling (by similarity). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEL1L. The function of SEL1L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM99. Thiamin Pyrophosphokinase 1 (TPK1, Accession NM_022445) is another VGAM209 host target gene. TPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPK1 BINDING SITE, designated SEQ ID:1988, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6313] Another function of VGAM209 is therefore inhibition of Thiamin Pyrophosphokinase 1 (TPK1, Accession NM_022445), a gene which catalyzes the conversion of

thiamine, a form of vitamin B1, to thiamine pyrophosphate . Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPK1. The function of TPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. Chromosome Y Open Reading Frame 14 (CYorf14, Accession NM_018542) is another VGAM209 host target gene. CYorf14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYorf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYorf14 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6314] Another function of VGAM209 is therefore inhibition of Chromosome Y Open Reading Frame 14 (CYorf14, Accession NM_018542). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYorf14. HSPC228 (Accession NM_016485) is another VGAM209 host target

gene. HSPC228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC228 BINDING SITE, designated SEQ ID:1688, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6315] Another function of VGAM209 is therefore inhibition of HSPC228 (Accession NM_016485). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC228. MGC1127 (Accession NM_033549) is another VGAM209 host target gene. MGC1127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1127 BINDING SITE, designated SEQ ID:2336, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6316] Another function of VGAM209 is therefore inhibition of MGC1127 (Accession NM_033549). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1127. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 4 (SLC16A4, Accession NM_004696) is another VGAM209 host target gene. SLC16A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC16A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A4 BINDING SITE, designated SEQ ID:1144, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6317] Another function of VGAM209 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 4 (SLC16A4, Accession NM_004696). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A4. LOC147180 (Accession XM_097207) is another VGAM209 host target gene.

LOC147180 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147180 BINDING SITE, designated SEQ ID:3292, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6318] Another function of VGAM209 is therefore inhibition of LOC147180 (Accession XM_097207). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147180. LOC148195 (Accession XM_097419) is another VGAM209 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:3297, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6319] Another function of VGAM209 is therefore inhibition of LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC158572 (Accession XM_088608) is another VGAM209 host target gene. LOC158572 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158572 BINDING SITE, designated SEQ ID:3221, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6320] Another function of VGAM209 is therefore inhibition of LOC158572 (Accession XM_088608). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158572. LOC201595 (Accession XM_114346) is another VGAM209 host target gene. LOC201595 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201595, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201595 BINDING SITE, designated SEQ ID:3453, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6321] Another function of VGAM209 is therefore inhibition of LOC201595 (Accession XM_114346). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201595. LOC203427 (Accession XM_114699) is another VGAM209 host target gene. LOC203427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203427 BINDING SITE, designated SEQ ID:3464, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:544.

[6322] Another function of VGAM209 is therefore inhibition of LOC203427 (Accession XM_114699). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC203427. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 210 (VGAM210) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6323] VGAM210 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM210 was detected is described hereinabove with reference to Figs. 1–8.

[6324] VGAM210 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM210 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6325] VGAM210 gene encodes a VGAM210 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM210 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM210 precursor RNA is designated SEQ ID:196, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:196 is located at position 110952 relative to the genome of Vaccinia Virus.

[6326] VGAM210 precursor RNA folds onto itself, forming VGAM210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6327] An enzyme complex designated DICER COMPLEX, `dices` the VGAM210 folded precursor RNA into VGAM210 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM210 RNA is designated SEQ ID:545, and is provided hereinbelow with reference to the sequence listing part.

[6328] VGAM210 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM210 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6329] VGAM210 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM210 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM210 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[6330] The complementary binding of VGAM210 RNA, herein designated VGAM RNA, to host target binding sites on VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM210 host target RNA into VGAM210 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6331] It is appreciated that VGAM210 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM210 host target genes. The mRNA of each one of this plurality of VGAM210 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM210 RNA, herein designated VGAM RNA, and which when bound by VGAM210 RNA causes in-

hibition of translation of respective one or more VGAM210 host target proteins.

[6332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM210 gene, herein designated VGAM GENE, on one or more VGAM210 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6333] It is yet further appreciated that a function of VGAM210 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM210 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM210 correlate with, and may be deduced from, the identity of the host target genes which VGAM210 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [6334] Nucleotide sequences of the VGAM210 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM210 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM210 are further described hereinbelow with reference to Table 1.
- [6335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM210 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM210 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [6336] As mentioned hereinabove with reference to Fig. 1, a function of VGAM210 gene, herein designated VGAM is inhibition of expression of VGAM210 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM210 correlate with, and may be deduced from, the identity of the target genes which VGAM210 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6337] Phosphodiesterase 1A, Calmodulin-dependent (PDE1A, Accession NM_005019) is a VGAM210 host target gene. PDE1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE1A BINDING SITE, designated SEQ ID:1171, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:545.

[6338] A function of VGAM210 is therefore inhibition of Phosphodiesterase 1A, Calmodulin-dependent (PDE1A, Accession NM_005019), a gene which is a Ca^{2+} -calmodulin dependent cyclic nucleotide phosphodiesterase and has a higher affinity for cGMP than for cAMP. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE1A. The function of PDE1A has been established by

previous studies. Phosphodiesterase 1 is a membrane-bound exonuclease that hydrolyzes phosphodiester bonds. See 171885. Wilson and McKenna (1988) examined the segregation of the gene for human phosphodiesterase 1A in human-rodent somatic cell hybrids. Electrophoretic analysis of phosphodiesterase 1A in hybrids suggested that the enzyme is a monomer. The PDE1A gene segregated concordantly with human chromosome 4 in all but 1 of 26 hybrids examined and showed 4 or more instances of discordance with all other chromosomes. By screening a hippocampus library with a bovine 61-kD CaM PDE cDNA, Loughney et al. (1996) isolated cDNAs encoding PDE1A (HCAM1) and PDE1C (HCAM3; 602987). The sequence of the predicted 535-amino acid protein is 94% identical to that of the bovine 61-kD CaM PDE when 2 short regions unique to PDE1A are excluded from comparison. Northern blot analysis revealed tissue-specific expression of 4.8-, 2.4-, and 2.6-kb PDE1A mRNAs, with transcripts most abundant in brain, heart, kidney, and skeletal muscle. Although expression of full-length PDE1A in *S. cerevisiae* did not result in PDE activity, an amino-truncated protein gave measurable PDE activity with higher affinity for cGMP than for cAMP.

- [6342] Further studies establishing the function and utilities of PDE1A are found in John Hopkins OMIM database record ID 171890, and in cited publications numbered 2987-2988 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ElcC Homolog 1 (E. coli) (ELAC1, Accession XM_165659) is another VGAM210 host target gene. ELAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ELAC1 BINDING SITE, designated SEQ ID:3506, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:545.

[6343] Another function of VGAM210 is therefore inhibition of ElaC Homolog 1 (*E. coli*) (ELAC1, Accession XM_165659). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELAC1. LOC154790 (Accession XM_088044) is another VGAM210 host target gene. LOC154790 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154790 BINDING SITE, designated SEQ ID:3191, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:545.

[6344] Another function of VGAM210 is therefore inhibition of LOC154790 (Accession XM_088044). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC154790. LOC158434 (Accession XM_098939) is another VGAM210 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:3389, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:545.

[6345] Another function of VGAM210 is therefore inhibition of LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 211 (VGAM211) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6346] VGAM211 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM211 was detected is described hereinabove with reference to Figs. 1–8.

[6347] VGAM211 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6348] VGAM211 gene encodes a VGAM211 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM211 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM211 precursor RNA is designated SEQ ID:197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:197 is located at position 110025 relative to the genome of Vaccinia Virus.

[6349] VGAM211 precursor RNA folds onto itself, forming VGAM211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6350] An enzyme complex designated DICER COMPLEX, `dices` the VGAM211 folded precursor RNA into VGAM211 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM211 RNA is designated SEQ ID:546, and is provided hereinbelow with reference to the sequence listing part.

[6351] VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM211 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6352] VGAM211 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM211 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM211 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[6353] The complementary binding of VGAM211 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM211 host target RNA into VGAM211 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6354] It is appreciated that VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM211 host target genes. The mRNA of each one of this plurality of VGAM211 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM211 RNA, herein designated VGAM RNA, and which when bound by VGAM211 RNA causes inhibition of translation of respective one or more VGAM211 host target proteins.

[6355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM211 gene, herein designated VGAM GENE, on one or more VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6356] It is yet further appreciated that a function of VGAM211 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM211 correlate with, and may be deduced from, the identity of the host target genes which VGAM211 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6357] Nucleotide sequences of the VGAM211 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM211 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM211 are further described hereinbelow with reference to Table 1.

[6358] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM211 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM211 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6359] As mentioned hereinabove with reference to Fig. 1, a function of VGAM211 gene, herein designated VGAM is inhibition of expression of VGAM211 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM211 correlate with, and may be deduced from, the identity of the target genes which VGAM211 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6360] Mitogen-activated Protein Kinase Kinase Kinase 5 (MAP3K5, Accession NM_005923) is a VGAM211 host target gene. MAP3K5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by MAP3K5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K5 BINDING SITE, designated SEQ ID:1261, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:546.

[6361] A function of VGAM211 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 5 (MAP3K5, Accession NM_005923), a gene which phosphorylates and activates two different subgroups of map kinase kinases, mkk4/sek1 and mkk3/mapkk6 (or mkk6). Overexpression induces apoptotic cell death. Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K5. The function of MAP3K5 has been established by previous studies. Mitogen-activated protein kinase (MAPK) signaling cascades include MAPK or extracellular signal-regulated kinase (ERK), MAPK kinase (MAP2K, also called MKK or MEK), and MAPK kinase kinase (MAP3K, also called MAPKKK or MEKK). MAPKK kinase/MEKK phosphorylates and activates its downstream protein kinase, MAPK kinase/MEK, which in turn activates MAPK. The kinases of

these signaling cascades are highly conserved, and homologs exist in yeast, *Drosophila*, and mammalian cells. Ichijo et al. (1997) used a similar cloning strategy to identify a nearly identical MAPKKK cDNA, termed ASK1 for apoptosis signal-regulating kinase. The deduced protein contains 1,375 amino acids, and is most closely related to yeast SSK2 and SSK22, which are upstream regulators of yeast HOG1 MAPK. ASK1 expression complements a yeast mutant lacking functional SSK2 and SSK22. ASK1 also activates MKK3 (OMIM Ref. No. 602315), MKK4 (SEK1), and MKK6 (OMIM Ref. No. 601254). Overexpression of ASK1 induces apoptotic cell death, and ASK1 is activated in cells treated with tumor necrosis factor- α (TNF α ; 191160). Nishitoh et al. (1998) showed that ASK1 interacts with members of the TRAF family and is activated by TRAF2 (OMIM Ref. No. 601895) in the TNF-signaling pathway. After activation by TRAF2, ASK1 activates MKK4, which in turn activates JNK. Thus, ASK1 is a mediator of TRAF2-induced JNK activation. Animal model experiments lend further support to the function of MAP3K5. Using a forward genetic screen of *C. elegans* mutants, Kim et al. (2002) showed that viable worms lacking *esp2* and *esp8*, homologs of the mammalian MAP kinases SEK1 and ASK1,

were highly susceptible to and died more rapidly from both a gram-negative bacterium, *P. aeruginosa*, and a gram-positive organism, *E. faecalis*, than wildtype worms. RNA-interference and biochemical analyses likewise implicated the p38 MAP kinase homolog, *pmk1*, in susceptibility to these pathogens. Kim et al. (2002) concluded that MAP kinase signaling, which is also involved in plant pathogen resistance, is a conserved element in innate metazoan immunity to diverse pathogens.

[6362] It is appreciated that the abovementioned animal model for MAP3K5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6363] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6364] Kim, D. H.; Feinbaum, R.; Alloing, G.; Emerson, F. E.; Garsin, D. A.; Inoue, H.; Tanaka-Hino, M.; Hisamoto, N.; Matsumoto, K.; Tan, M.-W.; Ausubel, F. M. : A conserved p38 MAP kinase pathway in *Caenorhabditis elegans* innate immunity. *Science* 297: 623-626, 2002. ; and

[6365] Nishitoh, H.; Saitoh, M.; Mochida, Y.; Takeda, K.; Nakano, H.; Rothe, M.; Miyazono, K.; Ichijo, H. : ASK1 is essential

for JNK/SAPK activation by TRAF2. Molec. Cell 2: 389–395, 1998.

[6366] Further studies establishing the function and utilities of MAP3K5 are found in John Hopkins OMIM database record ID 602448, and in cited publications numbered 1352–1354, 2295, 3027, 2366–2367, 146 and 1472 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP564F0522 (Accession XM_043885) is another VGAM211 host target gene. DKFZP564F0522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564F0522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F0522 BINDING SITE, designated SEQ ID:2825, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:546.

[6367] Another function of VGAM211 is therefore inhibition of DKFZP564F0522 (Accession XM_043885). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F0522. GPCR150 (Accession NM_014373)

is another VGAM211 host target gene. GPCR150 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPCR150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPCR150 BINDING SITE, designated SEQ ID:1496, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:546.

[6368] Another function of VGAM211 is therefore inhibition of GPCR150 (Accession NM_014373). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPCR150. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832) is another VGAM211 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:2340, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ

ID:546.

[6369] Another function of VGAM211 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231) is another VGAM211 host target gene. SLC6A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A14 BINDING SITE, designated SEQ ID:1369, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:546.

[6370] Another function of VGAM211 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A14. LOC116228 (Accession XM_057659)

is another VGAM211 host target gene. LOC116228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116228 BINDING SITE, designated SEQ ID:2980, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:546.

[6371] Another function of VGAM211 is therefore inhibition of LOC116228 (Accession XM_057659). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116228. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 212 (VGAM212) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6372] VGAM212 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM212 was detected is described

hereinabove with reference to Figs. 1–8.

[6373] VGAM212 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6374] VGAM212 gene encodes a VGAM212 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM212 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM212 precursor RNA is designated SEQ ID:198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:198 is located at position 111922 relative to the genome of Vaccinia Virus.

[6375] VGAM212 precursor RNA folds onto itself, forming VGAM212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6376] An enzyme complex designated DICER COMPLEX, `dices` the VGAM212 folded precursor RNA into VGAM212 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM212 RNA is designated SEQ ID:547, and is provided hereinbelow with reference to the sequence listing part.

[6377] VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM212 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM212 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6378] VGAM212 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM212 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM212 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM212 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM212 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6379] The complementary binding of VGAM212 RNA, herein designated VGAM RNA, to host target binding sites on VGAM212 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM212 host target RNA into VGAM212 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6380] It is appreciated that VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM212 host target genes. The mRNA of each one of this plurality of VGAM212 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM212 RNA, herein designated VGAM RNA, and which when bound by VGAM212 RNA causes inhibition of translation of respective one or more VGAM212 host target proteins.

[6381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM212 gene, herein designated VGAM GENE, on one or more VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6382] It is yet further appreciated that a function of VGAM212 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM212 correlate with, and may be deduced from, the identity of the host target genes which VGAM212 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6383] Nucleotide sequences of the VGAM212 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM212 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM212 are further described hereinbelow with reference to Table 1.

[6384] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM212 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM212 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6385] As mentioned hereinabove with reference to Fig. 1, a function of VGAM212 gene, herein designated VGAM is inhibition of expression of VGAM212 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM212 correlate with, and may be deduced from, the identity of the target genes which VGAM212 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6386] Cyclin C (CCNC, Accession NM_005190) is a VGAM212 host target gene. CCNC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNC BINDING SITE, designated SEQ ID:1192, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6387] A function of VGAM212 is therefore inhibition of Cyclin C (CCNC, Accession NM_005190), a gene which is involved in the control of cell cycle and can regulate transcription by targeting the CDK7 /cyclin H subunits of the general transcription initiation factor IIH . Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNC. The function of CCNC has been established by previous studies. See 123837. Lew et al. (1991) isolated a number of cDNAs derived from human mRNAs that were able to substitute for G1 cyclin genes in *S. cerevisiae*. Several of these encoded human cyclins A, B1, and B2. Three novel genes were identified, which they called cyclins C, D, and E. The 3 novel proteins were sufficiently distantly related to the other members of the cyclin family and to each other as to constitute 3 new classes of cyclins. Cyclin C and E mRNAs accumulated periodically during the cell cycle, peaking at different times in G1. Mammalian CDK8
